When you are scanning, it turns the channel group assigned to GQK 2 in the current system on or off.

In hold mode, it turns on the search you've assigned to sr2 on.

Guy: Sorry, I didn't make it through the entire email. But, when F(unc) is activated, the scanner does not move off of the current system. If you miss the system when you hit F, you can scroll back to it (F will stay activated), then hit 2.

I'm new to this scanner, what does Func 2 do?

From: Guy Teague
Topic: 7003 Message: 7007

it toggles the status of (enables or disables) group #2 of the current system. in other words, if arlington were the system and group #1 was the fire dept and group #2 was the police department, hitting function +1 and function +2 while the arlington system was displayed and scanning will let you choose to monitor either or both groups. but function +2 does something entirely different if you hold function too long or if you have the scanner in hold on that group.

all i can say is that unless you're more attuned to the scanner than i am, you have a _lot_ of reading ahead of you! [g] good luck.

Sound like you might want to add a GPS to your setup. That way, it could enable/disable things without any user input to enable/disable them.

7010. RE: [BCD396XT] Re: Fried It I think

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-10-09 19:19:51 UTC
From: Michael Hopkins
Topic: 6993 Message: 7010

I'm guessing the problem isn't with the grounding of the speaker but more likely something else since the message comes up saying the voltage is too high (or too low?). Grounding everything together is typically not a bad idea but grounding a speaker wire is typically not done on purpose.

Shorting out the speaker probably wouldn't kill the unit. It's possible, but audio outputs are often transformer coupled and floating, so grounding one side or the other likely wouldn't hurt anything. I certainly wouldn't ground one side of the speaker anyway since it wouldn't do you any good anyway. On my XT, the low side is NOT grounded, so it's likely floating but may get grounded somehow back through the low side of my computer audio input jack or the audio input connection on an amplified speaker - don't know; haven't checked.

Regarding the starter current story below:

If the battery ground wire is missing, seems to me two things are required to make the starter motor current flow to the radio:

1. a ground wire direct from the battery to the radio

2. a ground connection from the radio back to the chassis.

Otherwise not only would the starter motor not operate, but no other electrical circuit would function, including the starter relay. The only way I can see to make starter current flow through the XT when you have a direct connection to the battery is to use an external antenna where the low side of the antenna is bonded to vehicle chassis - a magnetic mounted antenna wouldn't do it. Even in this case, it assumes the wire to the battery is NOT made out of the same skinny wire that comes with the charger. The skinny wire will likely act as a fuse and open up on its own when you try to run >100A through it. But since my antenna is a mag mount with no DC connection to the chassis, I'm still safe.

I guess if you use a large enough wire size back to the battery AND use an external antenna where the low side is bonded to the chassis (not a mag mount or glass mount) you could burn up PCB track between the DC negative input connector and the antenna connector. I'm only guessing, but I'd bet it would happen pretty quick ------

Hope this is helpful to someone.

Subject: Re: [BCD396XT] Re: Fried It I think

If you will only accept an answer from UPMan, that is fine. But, I will tell you that you shorted one side of the speaker to ground and increased the load on the audio amp. Again, if you don't want to believe me that is fine.

I will let you know that many radios do not use speakers that are grounded on one side. It may not be common knowledge, but it should be. Never assume anything about radio design.

As for speakers, the colors can be anything the manufacturer puts in them. It's usually what is supplied by the speaker manufacturer (who has no idea what they are being connected to). I've seen black/red, two blacks, two whites, two greys, yellow/gray, Etc. Sometimes one side of the speaker was grounded. Often, it is not.

Why didn't you use a meter to check the voltages between the points you were connecting? (often if there is a voltage difference it's not a good idea to connect those points)

Here is one more common error that ill-informed people do: They connect the ground side of a mobile radio to the battery. NEVER do that. I had a competitor install a commercial two-way radio in a vehicle this way. The vehicle lost the ground between the chassis and the battery. Guess where ALL the starting current went; Right through the radio's ground wire which was the only path left. It literally fried the radio and they are lucky they didn't burn the vehicle up. Just another one of those things that should be common knowledge, but isn't. Some will say if you fuse that like, it makes it OK. It still isn't OK. Just connect the ground side of the radio to the chassis.

I know none of this does you any good at this point, but maybe it will help the next person. When in doubt, ask first. I'm pretty sure the manual does say to not ground the speaker.

In this case, the ground wire was run directly to the battery (hence the original comment to not run the ground wire to the battery), and the chassis of the radio was grounded (likely for RF suppression reasons).

Granted, there are cases where there would not be the complete path, but it's far better to just ground anything to the chassis rather than the battery.

Of course, you could also insulate all the other grounds, but it's much easier to simply not run the ground wire to the battery.

And yes, the chassis connection could be via the radio mount (where the case of the radio is grounded internally), via the antenna, via a speaker, or even via a GPS that is powered from the vehicle. Grounds are a good thing to have - just not right to the battery for that one reason.

It's also true that the path won't last forever under a starter load, but by the time the path "fuses", the damage will have been done. The same can even be said for adding a fuse to the ground line. It will blow, but what else is damaged in the process?

But, the suggestion of eliminating item 1 in your scenario is the easiest (and safest) solution.

I agree ---- One thing I didn't mention is the use of fuses in both positive and negative wires to the battery. That also works to prevent problems. I run both wires to the battery for a 100 watt transceiver so I don't have high ground currents from the transceiver running all around the car --- reduces the chances of noise problems from ignition as well and the likelihood of transients from other electronics and electrical systems getting to my radio. Power for my XT comes from a cigarette lighter type power connector. All seems to work well..

Subject: [BCD396XT] Re: more operational mishaps ...

wow! so much for using the 'rich text editor', it scrambled up my post to a fare-thee-well. i assure you, it looked much much better on my screen when i hit the |send| key.

i just wanted to add that i mean no criticism of paul or uniden when i say i'm having trouble operating this scanner. i guess i make it sound like a big deal because i've been a 'gadget guy' all my life--people used to come to me to program their casio watches way back when 'cause i was the only one able to figure it out for nearly any model.

so, losing the battle over knowing how to operate a gadget is an anomaly for me, but the bcd396xt is not unique in that regard, although rare. for one example, the yaesu vx7r (which is still in a bag somewhere in my house--lost but not mourned-- and non-operational defeated me. there were too many disparate functions assigned to too few keys. and i wasn't alone, people started putting out users guides and i remember carrying one around in my shirt pocket that was 84 pages! and that was the 'quickref' guide! and it wasn't just me--this radio alone was famous for defeated seniors with weak eyes and failing memories such as me.

but the yaesu is just one of a handful of comparable radios--it's not like i _had_ to learn it or go without. i just picked up a kenwood th-f6a last week and although it's the first kenwood i've ever owned or used, i took one trip through the less-than-50-page manual and then did about 20 minutes of programming and i feel like i can understand and make use of about 90-95% of the capability of this radio despite it having nearly as many functions and features as the yaesu. the difference has to be in the philosophy of the user interface since the size and layout is essentially the same between the two radios with the exception of kenwood adding a handy 4-way 'mouse' button. and yaesu is not the only 'sinner' in this regards. some of the aor and icom models are not the easiest to use either, making kenwood's accomplishment all the more remarkable.

but the bcd396 is different in that it is a brilliant brilliant engineering accomplishment and up until perhaps a couple of years ago there's been nothing remotely close to compare it to or to go buy if you couldn't deal with the uniden. and i haven't seen any of the gre or ratshack scanners, but ratshack has a long and deep reputation for having some of the most user-unfriendly and buggy user-interfaces going. i have never been truly happy with anything whatsoever i've purchased from them--it's nearly always been a case of needing

something too badly and they happen to have it. but, i take that back. my radioshack race and 800mhz antennas are outstanding. but i've bought hundreds of feet of bad rg58 and pl259 connectors from them. anyway, i digress ... .

so i keep hammering away at the 396t and xt because they are brilliant. but i think it's apparent that i'm one of the ones that just can't grok the paradigm of any logic the user commands represent. i have a digital audio recorder which is much the same with about 4 functions for each key depending on how, how much, and when and what mode you press the key. but an audio recorder has an order-of-magnitude less functions and operations than this scanner and it's manageable though irritating and necessitates repeat visits to the manual to bump the memory.

If the audio output stage uses a bridged output stage (a common way
to increase output power on a limited DC supply voltage), then
connecting one side of the speaker to ground will put one of the
halves of the audio amp across the DC supply, putting stress on that
output transistor and any voltage regulators in circuit. Another
potential issue is if voltage regulation takes place on the negative
side of the supply. In this case, you'd short out the regulator
and expose the radio to overvoltage.

From: Lance Star
Topic: 7023 Message: 7023

I was at Radio Shack, and noticed they had a Enercell Car Power Adapter on clearance for $4.97. Part #273-368.
It's rated at 6VDC@1000ma. I also got a right angle Adaptaplug Tip "B" series. It's specs are:

4.00mm O.D.
1.7mm I.D.

When you buy the Car Power adapter, you get an Adaptaplug tip included in the price. Part # 273-335
That's saved $6.95. So this made the whole setup real attractive for $5.38 total.

I noticed when I seated the tip plug into the radio there is a slight bit of play, compared to the plug that comes
furnished with the Uniden AC Adapter...

I haven't check the specs on the Uniden plug, but this made me wonder if the plug is unique...

From: TrkNTrlrMan
Topic: 7025 Message: 7025

My scanner has been working just great untill last monday, It was scanning, and working as normal and all of a sudden it shut off...Hmmmm I thought maybe the batteries were down so I turned it back on, pushed the volume knob, and it showed 3.8 volts, no problem, so I left it on, and in a few minutes poof, it went off again...So, I took off the battery cover, and removed the batteries, checked the contact points, (all was well) and replaced the batteries. Turned the scanner back on and all was well ..it worked for about 10 min. and then went Off again. Once again I turned the scanner back on, and I get this wierd static, and very loe volume like the antenna is not working properly, and then Poof off it goes again. Hmm so back on it goes, and now i'm getting what looks like a bar code across the screen, it blinks and then a streight line across the middle of the screen, and poof it's off again...It does this on batteries, or the car charger. The Batteries are freshly charged, and th scanner has never been dropped or dammaged.

Any one have any Ideas? or has anyone else had this problem???

UPMAN, where are you?????? Help!!!!!

I don't know what the technical cause would be, but it is almost certainly an issue requiring repair.

I can't see how a "hosed" system would cause that. It could be a bad
cell, but I don't know if "TNTM" (he didn't post his name) tried the
charger with or without the cells.

It definitely sounds like something is wrong in the power system.

If I had to make an educated guess, I might even guess the CPU. That
brings up an interesting possibility: Do you have the latest firmware?
If not, try uploading the latest. It's remotely possible it could be
corrupted firmware.

If you go to the Uniden web site under support you can fill out a repair form to print and include with the scanner when you return it. Their flat repair rate is $49.50 plus an additional $10.00 for return shipping.

I recently returned a BC898T to them to have the damaged front panel/case replaced. I shipped it to them via UPS. They return by USPS. At one time the front panel was available thru their parts dept., but is no longer available. However, it was available thru their repair dept. It took about 3 weeks total time from the day I shipped the unit to them until I got it back.

Looks like the slight play in the way the plug feels once seated in the radio is due to the EIAJ TYPE-II jack has an O.D. of 4.4mm, while the plug (Adaptaplug "B") from Radio Shack is spec'd at 4.0mm, so 4 tenths of a millimeter in difference...
Anyone know where I can source the plugs Uniden uses?
Thanks,
-Lance

7033. Still having P25 trouble

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-10-21 04:38:11 UTC
From: Alex
Topic: 7033 Message: 7033

Ok, I'm still having trouble getting reliable decodes on P25 even when I'm in close range of the transmitter. The transmissions break up frequently no matter the antenna.

But, here's another interesting thing I noticed. If I turn on the radio normally, I have trouble with the P25 decoding. If I turn it on using Hold+power (which activates the hidden P25 menu items), decoding improves a bit. Was that supposed to be a feature of the updated firmware or is it supposed to use the hidden menu settings at all times regardless of power up mode?

Well, I bought a DC regulator, so I could run my scanner. None of
the plugs available will fit the 396XT. :(

Also try a new set of batteries just to rule them out as well. I hope you get it fixed and don't have to send it in for repair. Lots of good tips given, try those tips first and see what happens. Hopefully you can narrow it down to something simple.

Take care,
Joe

Mode as in modulation or something else?

The systems are programmed to use NFM Digital audio only (not auto). I suppose I could try to use the wider FM mode.

If you don't mind cutting the cord and splicing a whole new connector on there then go to Digikey or Mouser. They have the proper sized barrel connector in both straight and right angle configurations.

I made my own 12 volt adapter and bought a cord from Digikey (Mouser has the same ones, too) that had a molded, right angle connector on the end. Works fine, no loose connections.

"Illegal voltage" will also be displayed if the voltage is too low (I think it appears around 5.0 V, it happens a lot when I power from an external battery that has run low.)

Alex,
I was thinking of doing that. Radio Shack's connector series has a loose spec from what I read on Wikipedia.
Do you have part numbers from mouser and digikey? That would be helpful.
Thanks again,
-Lance

I don't have the part numbers but both sites have good search engines that filter by specification so you'll be able to find the parts pretty easily.

Both Digikey and Mouser sell this configuration which is what I purchased. It's a molded connector with bare leads on the other end. The wire is somewhere between 6 and 10 feet long so you have plenty of options. When you use the catalog search features of either site you should come across them pretty quickly.

Digikey's search is under the Product Index where you then select the product category and subcategory -- in this case Connectors, Barrel - Power should get you started and will eventually show you the filter list. Mouser's search starts by selecting the large categories on their main page -- I think "Connectors" and then "DC Power Connectors" will give you bare connectors while "Wire and Cable" and then "Cable Assemblies" will get you the molded connectors with wire and the filter list, too.

Details GRE Official Announcement 10/23/2012

October 23, 2012

To our valued Dealers and Customers,

Due to circumstances beyond its control, General Research of Electronics
of Japan (GRE)
is temporarily not able to manufacture the GRECOM and Radio Shack
branded radio scanners.

The Chinese Governmentâ☐☐s plan to redevelop the area where the GRE
factory had been in
operation for over ten years finally forced its closure. Anticipating
this eventuality,
GRE was in the process of building a new factory but unfortunately the
cost of raw materials,
labor and increased taxes created a heavy financial investment burden
that could not be
effectively recovered.

GRE America continues to market, support and service the GRECOM branded
scanners and is
contractually committed to keep the Library Database updated and
current. GRE America
will continue to market, service and support Alincoâ☐☐s radio
products without any interruption.

We sincerely apologize for this unfortunate turn of events. GRE is
proceeding to establish
a contract with a new factory and believes it will be able to restart
the manufacturing in
the near future.

For continued sales, service and support, please contact the GRE America
office.

Raj Gounder
Director of sales
GRE America, Inc.

Not as cheap as others, but the BTT005 looks pretty small - maybe half
the size of the A120S (about the same size, but half as thin). Looks to
be in the $25-35 shipped range on eBay.

I haven't tried these, so I can't say how well they work, but it's got
the right plug on it.

There are other units that are around $10 shipped, but they look larger.
Still, that should work. for those, search on the terms "bluetooth
adapter 3.5 -usb" (minus the quotes, of course).

Thanks Joe,
I had found and ordered a refurbished (warranted) Jabra A210 $29.95. I'll see if it's working when it arrives.
I know my ear piece works with that one and I have a 2.5 to 3.5 adapter.

Clark

Can you send screenshots so I can see what it's doing?

Topic: 3874 Message: 7054

Hello,

How do I turn on the NAC decode setting?

Thanks,

Greg

7055. Re: [BCD396XT] Logging with Proscan

I am including a screen shot, as you look at the UID (FC)
Proscan is over writing the last entry. I am using serial
port to USB converter and every thing works as it should
apart from this niggle. Is the short transmission time not
allowing the computer to catch up?
Thank for the reply
Alan

Program the channel as digital and set the audio option to
NAC SEARCH or the specific NAC code you want to hear.

You may want to upload that to the PHOTOS section of the list.

From: David
Topic: 3874 Message: 7058

P25 NAC Option (P25-1Tr only) allows you to have the scanner search for NAC codes or you can program a specific code for the system.
Scroll to 'P25 NAC Option' and press E/yes.
Scroll to one of two settings and press E/yes.
Search- The scanner opens squelch for any digital signal and displays the NAC being used.
Set P25 NAC- The scanner opens squelch only for signals that include the programmed NAC.
At 'Input P25 NAC' see Entering Text

Make sure Weather Priority and Channel Priority are turned off.

Also, if you are using Close Call, make sure it's in the CC DND mode
(Close Call Do Not Disturb).

I believe that is the "Priority " setting. I Believe you go to the channel setting and turn priortiy off for the individual channel its set to on for

hope this helps

I didn't realize yesterday when I saw an email from you that this came in via the yahoo group. Software support by me or anyone shouldn't be done on these groups as it boogs down the board and the board is for the BCD396XT.

Please email me at bob@...
Include the ProScan version and the name of the file that you are looking at. A quick look is the data you posted doesn't match the format of any of the ProScan files.

If you mean the acronym, it's in the quoted text.

If you mean what it does, it eliminates the
sampling of CC when receiving a transmission.

From: Clark Rennie
Topic: 7047 Message: 7069

A follow up on this topic.
I ordered and received a BTT005 but it will not pair with my Jabra BT125 headset.
It might be because I don't think the BT125 is a A2DP profile and the manual for the BTT005 states that it supports A2DP profile.
I don't know if that means A2DP only or what.

I also ordered and received a refurbished Jabra A210 Bluetooth adapter and it works perfectly with my BT125.

Maybe contact the seller and see what they say.

If I recall correctly, the A2DP profile allows your headset to connect
to more than one device at the same time. For example, I have mine
paired to both my phone and scanner adapter, so when I get a call it
switches to the phone. (a very nice feature)

7073. Bluetooth Adapter BTT005

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-11-15 00:06:23 UTC
From: Clark Rennie
Topic: 7047 Message: 7073

The BTT005 will only pair with a A2DP device. I found a Jabra A530 (with A2DP Profile) that I had and the BTT005 did pair perfectly with it.
So, if you're planning on using this adapter with your scanner, make sure your Bluetooth headset has A2DP technology.

You're a little vague, but do you have the System Hold function enabled?
You can tell by the flashing HOLD icon on the display. If so, hold the
HOLD button until it returns to normal (a couple seconds or so).

How do I enable i-call on a motorola stystem and can I set it up in its own group.
Do I have to but all the ID's I am intersted in in or os there a wild card setting.
Do I have to listen in search or can I listen in scan.
I have tried finding the i call setting direct into the scanner but cannot find a setting.
Cheers
Brian S

http://www.uniden.com.au/RESOURCES_MAIN/pdfs/UBCD396XT_OM.pdf

Pg 140

I-Call channel (Motorola, P25 or EDACS)
Enter the Talk Group ID in the following format:
i{ID number}
Press the decimal key to enter the lower-case i, then enter the ID number.
To monitor all iCalls, enter the iCall wildcard i0 in decimal or i in HEX.

I live in Covington, Louisiana. I go across the lake a lot and have Jefferson parish sheriffs, New Orleans Fire,Gretna EMS, NOLA EMS. EJGH EMS, WJGH EMS, Causeway Police,etc. I can get everything across the lake. However on the Northshore, I can only get JPSO Disp-1 ,2,4 NOT 3. I also cannot get NOFD at all JPFD, etc. ONLY NOPD and JPSO Disp-1, Disp.-2, Disp.-4. Also I would like to program my radio to all departments around me. Can anyone help me please. I really to listen to all channels that I listen to across the lake. Also sometimes I can get NOFD but has only happened once and goes away after a while (only when on the Northshore.)

if you join radioreference.com, then you can save off the data as a csv file for import into your programming application. and many programming apps such as arc-xt will import the pages from rr.com for you directly to your radio. i could never have programmed a single trunk system without it and i'm pretty savvy with radio programming.

From: Robert Klamp
Topic: 7099 Message: 7103

When using freescan go to file-->import-->import from radio reference and it should download all the frequencies you picked into the software. Then just set your quick keys and program the radio. Your now ready to scan.

Hope this helps,
Bob

Subject: Re: [BCD396XT] Need help downloading programming, software or whatever for my scanner

Hi,
I live in Ft. Wayne In. I would appreciate help downloading frequencies for my area. I'm looking at buying ARC-XT from Butel software or trying to use the soft ware that matches up to Freescan. However I'm having trouble seeing how to use freescan. I joined radioreference for 180 days. I've already sunk a ton of doe in this scanner and prefer to go the free route if I can. Good advice would be appreciated

Thanking you in advance, Mike weidemeier
 I don't know where to download frequencies on freescan. I loaded some software" sixspot" something. I can download frequency numbers from RR but I am not able to put them in my radio. Any help would be appreciated. Thanks, Mike Weidemeier

Can you elaborate on what about FreeScan is giving you trouble?

Can you download from RadioReference OK?

Anyone know if I can change the frequency limits of the Ham service search? I would like to omit the 900 MHz portion of the search, limiting the higher frequencies to the top end of the 440 band.

Bill

However ... you can go to "custom search" and enter a lower and upper frequency limit to search based on your likes. You can set up to 10 different search paramaters.

I think there are a bunch of BC XT users that never use the Custom
Search with Control Channel Only.
Great feature when traveling and your radio isn't programed for a system.
Also on Public Service systems it tells you who the owner of the control
channel you are monitoring is.

Don't forget for rebanding to go into the Menu under Edit Custom Serarch.
Select Set MOT Band Plan.
Select Custom.
Then Select Band Plan 1.
Select Set Base Freq lower = 851.025 upper=854.000
Select Set Offset = 440
Select Spacing = 25.00 khz

Gidday David,

I just add the talkgroups for my area for the GRN and then identify any new ones.

This might be difficult in your case if you take your scanner with you at work as you would cover
a good part of the state.

Regards,

Doug

Yes, but the system is so large it can take up to 20 seconds to go through all the control frequencies. If this is duplicated, it could then take 40 seconds before coming back to an active talk group.

Do you have the different sites programmed as different Sites in the scanner? If so, how many Sites are in range? There should only be a few sites in range at most locations, and the XT scanner should scan all of them within (in range and not in range) about 5 seconds or so.

Also, are you entering only the control frequencies or all frequencies on the system?

Something just sounds a little off with your setup.

I wasn't trying to be sarcastic. I was simply pointing out that the
other thread which "announced" the new firmware specifically said it was
a pending release. As I understand it, the website says that, too.

7122. Firmware Release suggestion

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-12-29 17:00:48 UTC
From: Doug Hutton
Topic: 7122 Message: 7122

UPMan:

Since you are releasing an update, may I suggest a minor change that would be
very helpful to me and perhaps others.

When HOLD is pressed while trunk scanning, the scanner holds on the control channel. It would be much more helpful to hold on the last received channel.

There are times when I hear something unusual or interesting and scanning resumes before I can look at the display. I have DELAY set to 1 second and don't want to increase it.

Several years ago, I had a Uniden trunking scanner with a D suffix that behaved this way and it was very handy.

Doug H

>Since you are releasing an update, may I suggest a minor change...

Based on a posting Paul made on RadioReference, I think it may be too late to get any features added in this firmware update. In other words, the update is in the can. Maybe next time.

My impression is that the firmware is nearly done and awaiting final approval by Uniden's engineers. Paul built the update page on the Uniden wiki and created the links so he'd be ready to release the update as soon as the engineers approve it.

Bob...

The scanner must listen to the control (or home) channel in order to follow transmissions on the system.
In a very general sense that is the way any trunking system functions.
Likewise user radios in a trunking environment will always listen to the control channel or home channel.
In most trunking systems the control channel is a continuous data tranmission, all voice or digital voice communications occur on other channels in the system. The user radio listens for and finds the active control channel and stays there unless directed to a different channel by the system controller. Once the transmission or conversation that the user radio was directed to is over the user radio returns to the control channel.
In a basic LTR system the user radio remains on the home channel programmed into the user radio unless directed by the trunking controller to another channel in the system. Basic LTR systems can have each system frequency function as a home channel depending on how the system is designed.
If the scanner held on the last received frequency you would not receive any transmissions until another call was sent to the channel on which the scanner was holding, and then only if listening in ID Search mode. The chances that this next call would be related to the one last heard are very limited.

Another option. How about a new scanner in the wings? (a 396/996xt updated version that is) It has been a couple years. I don't want to stir the pot but I would like to see one very soon.

Just a suggestion.

Based on a posting Paul made on RadioReference, I think it may be too late to get any features added in this firmware update. In other words, the update is in the can. Maybe next time.

My impression is that the firmware is nearly done and awaiting final approval by Uniden's engineers. Paul built the update page on the Uniden wiki and created the links so he'd be ready to release the update as soon as the engineers approve it.

Bob...

I am seeing a lot of city and business (power company and industrial) conversion to mototrbo and DMR. In amateur radio there is some use of Dstar. I guarantee i'd be a future customer of a scanner that can do all of those protocols, or have Software Defined DSP processors that could do that.
(I've tried DSD.exe and it works on all but Dstar) I have this kind of thing running on my base station but not in a portable.

Now the big question is Uniden able to provide the above?
The one interesting answer I heard was different hardware was needed. Yep a GMSK modem and the appropriate decoder. And what would the license costs per radio? So does that mean Uniden buys the decoder chip from someone else or do they have a programmer for the DSP firmware?

There is a little toll booth set up to use the AMBE IMBE codec that's 90% public domain algorithms.....look up the codec2 guy and listen to his discussions. When he discusses how codec2 works you can see the similarity to AMBE and IMBE.

And what to do about the departments that think its a good idea to encrypt everything? I make sure my Sheriff knows how helpful it is to hear them and get early warnings about accidents, bad weather, bad roads.

Also some new codecs are being promoted, such as codec2, a low bit rate codec.
Thats why uploadable codecs would be great along with combination modems that do c4fm cqpsk and gmsk at the most common data rates (with tdma if needed).

dsd.exe works for me and proves this isn't that hard to do. I haven't tried that on cqpsk but will be soon as I get discriminator taps installed. Thats been bringing new life to my old analog scanners.

Also I get full frequency coverage with those and unidens have lots of holes in their coverage.
I've been bugging the FCC to get rid of the "no cellular reception" rules, since everything here is cdma and a lot of receivers get the same format on PCS so why do you need "cellular blocking" if there is no more analog cellular?

Milton, I think you misunderstood Doug's request. Here's an example:

Scanning three control channels in a system:
Control 1
Control 2
Control 3

Scanner hits on Control 1, TG500.
Doug decides he wants to hold on Control 1, TG500, and begins moving his arm.
Transmission ends and scanning continues.
Doug's hand reaches the Hold button and presses it.
Scanner holds whatever it's currently scanning, e.g., Control 3.

Doug is requesting that, within a defined period (10 seconds?), Hold will not hold the current channel as it does now, but go back to the last hit. In this example, Hold would bring you back to Control 1, TG500, instead of quiet Control 3.

I agree with Doug that this change in behavior would very useful. I often find myself hitting Hold too late and having to disable scanning and manually recall the talkground to get back to what I want to listen to.

That's what the DELAY function is for, but he said he didn't want to use
that. I don't see the need for a new feature when a current feature
exists that will do what you want.

No, delay is different. Delay does not let you return to the last hit after scanning resumes. There are many reasons why you would want to keep delay short but have a way to return to the last hit.

7130. New to this

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-12-30 23:16:20 UTC
From: alan
Topic: 7122 Message: 7130

Hi Every one,
I use UBCD396xt AND Proscan
I have limited information on a Utility company operating on
the Australian P25 radio system
I have the TTGID 106XX and the radio tags
but no frequencies, how do I find the complete information
to program the scanner?

regards
Absolute novice

7131. AWIN - Finding CTRL Channel

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-12-31 00:32:39 UTC
From: ericfatherree
Topic: 7131 Message: 7131

I have a Uniden BCD396xt that I have been trying to program for this area. I have all the conv systems working "analog" and some of our agencies use the state AWIN system which is digital. The scanner come with Arkansas pre programed and when I try to scan those channels and have an officer use the radio to test it, the bottom of the screen scrolls "Finding CTRL Channel" does any one know what these means? Am I picking up the towers? or is there a setting that may need to be changed. I would like to pick up all the AWIN freq if possible.

7132. Kenwood Nextedge Digital

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-12-31 00:34:45 UTC
From: ericfatherree
Topic: 7132 Message: 7132

Does anyone know if the Nextedge Digital system will work on a scanner, the radio companies say you have to have specific radios to pick up the "Nextedge" system. I have it programed and settings in but will not pick up any traffic.

7133. Re: [BCD396XT] Kenwood Nextedge Digital

Topic: 7132 Message: 7133

You cannot decode Kenwood NXDG with any scanner. There are some people out there using a discriminator tapped receiver with special computer software. It's not easy and rather an involved process.

From: MCH
Topic: 7122 Message: 7134

The original problem was described as the scanner moving on before the operator had a chance to stop the scan. The delay would give enough time to stop it before it starts, so that would solve the issue of it starting to scan 'too fast'. You wouldn't have to return to the last active channel because the scanner would still be there.

I have a GRE unit that returns to the last active channel, and while that is sometimes nice, it has drawbacks, too. If you want to move several channels (or systems) ahead, you cannot because after you start the scan, wait, then stop it you are back where you started. So, you are forced to wear out the channel up button trying to get to a channel far from where you are.

What you need is a scanner that can read your thoughts of what you want to do, but I wouldn't hold my breath for that.

So, unless you want to create another problem, you have two choices:

1. Increase the delay so you have time to stop the scan where it is, or

2. Hit the button faster.

I would bet the info is available on Radioreference.com

It won't, and I doubt that it will ever be supported in any scanner
unless they come out with one that has user-installable CODECs.

That means it cannot find an active control channel. Most likely the preloaded data is pre-rebanding and you have to change the frequencies for post-rebanding. In most cases, that simply means lowering the frequencies by 15 MHz.

Joe M.

ericfatherree wrote:
> I have a Uniden BCD396xt that I have been trying to program for this area. I have all the conv systems working "analog" and some of our agencies use the state AWIN system which is digital. The scanner come with Arkansas pre programed and when I try to scan those channels and have an officer use the radio to test it, the bottom of the screen scrolls "Finding CTRL Channel" does any one know what these means? Am I picking up the towers? or is there a setting that may need to be changed. I would like to pick up all the AWIN freq if possible.

You could try logging the P25 site with Pro96Com software with your UBCD396XT scanner.
<http://www.psredit.com/pro96com/>

This system ?

Hi Every one,
I use UBCD396xt AND Proscan
I have limited information on a Utility company operating on the Australian P25 radio system I have the TTGID 106XX and the radio tags but no frequencies, how do I find the complete information to program the scanner?

regards
Absolute novice

Alex, If you are looking for Integral Energy, which I am only guessing from the TGID, you are in NSW, then you need to program the NSW Government Radio Service P25 network, with the transmitter site in your area, it's control channel and other frequencies. They are available at www.radioreference.com/apps/db/?sid= 6943

It seems to me that this could be resolved by simply building 3 identical Systems each one using its own Control Channel. That way between the display and the Quick Keys, you'll have control over what you want to hear.

By labeling the Systems and Sites accordingly (>>> Control 1
>>> Control 2>>> Control 3), you'd be able to - as quickly as your fingers will move - navigate to the System/Control Channel of interest. Use HOLD or DELAY at your discretion.

OR, hit HOLD and scroll back and forth until you hear the traffic you are following from the appropriate Control Channel(s), labeled accordingly.

In case anyone doesn't like this suggestion for any reason or thinks it won't work, please don't bother ripping it apart. It's my attempt at providing a workable solution.

Happy New Year!

Topic: 7131 Message: 7143

The pre-programmed stuff in all scanners is only as accurate as the sources used to determine it AT THE TIME IT WAS SOUGHT.

In other words if the person setting up the pre-programmed info looked at say Radio Reference before a system was rebanded and dumped that information into the firmware of the scanner, then the information is only acdcurate until the system is rebanded or some other change occurs. After that it is just useless information that cannot be changed and serves no useful purpose other than to confuse first time users.

Folks, y'all are making this suggestion WAY more complicated than it deserves. Of the 5 commenters, only Tom Hayward has thought this through carefully and understands what I would like to get fixed and why. He described my situation exactly with a little more detail than I provided.

The main EDACS system I monitor is large with lots of traffic. A longer DELAY is not a good solution because I would miss replies and other traffic. My suggestion is a very simple one with no downside that I can think of and deserves some serious consideration. Uniden has used it in a previous trunking scanner, so it must have some merit.

The original problem was described as the scanner moving on before the operator had a chance to stop the scan. The delay would give enough time to stop it before it starts, so that would solve the issue of it starting to scan 'too fast'. You wouldn't have to return to the last active channel because the scanner would still be there.

I have a GRE unit that returns to the last active channel, and while that is sometimes nice, it has drawbacks, too. If you want to move several channels (or systems) ahead, you cannot because after you start the scan, wait, then stop it you are back where you started. So, you are forced to wear out the channel up button trying to get to a channel far from where you are.

What you need is a scanner that can read your thoughts of what you want to do, but I wouldn't hold my breath for that.

So, unless you want to create another problem, you have two choices:

1. Increase the delay so you have time to stop the scan where it is, or

2. Hit the button faster.

I posted an example of a downside based
on the use of that exact feature.

Should it be considered, of course. But, it's not
a simple win-win feature. There are drawbacks.
(not to mention the fact that there will be users
whose scanner works one way, and others whose
scanner works a different way. That will confuse some)

If it is added, I would hope it will only be as a user-settable
feature, as I want the scanner to scan when it is in scan mode.

But if you want to return to the last hit by pressing hold how is that any different than the scanner waiting 4 more seconds or so before moving on. Sure you could have it do that but as soon as it picked up another transmission on another channel that would become your last hit. And will accomplish nothing but returning to a channel that if held for 5 seconds you would here the response anyway. And if Uniden did have it in earlier trunking models they must have had good reason to re-think its implementation and came to the same conclusion most people on the board did that it is unnecessary . If you want that feature so bad trade your 996 for a 500 GRE scanners do that and it drives me nuts.

There was a link posted, but I think the only thing it
addresses is enhanced performance on P25 LSM systems.

I would suspect that if they find the audio to be significantly improved
on the upcoming 396XT release, there will be one for the 996XT to make
the same change. This is just speculation, of course.

7157. 396XT/996XT problem?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-04 16:44:23 UTC
From: nz8j
Topic: 7157 Message: 7157

Hi,
I am very new to scanning using the trunked systems. My local sheriff and emergency services recently went to the Ohio Multi agency radio system. I have a 996XT that I was able to program using Freescan and importing frequencies from Radio Reference and can copy the new system the sherrif is using fine on the 996XT.

However I also have a 396XT hand held that for some reason I cannot get to receive the new frequencies. I went through the same procedures that I did for the 996XT but cannot receive the sheriff. I can copy all the other frequencies both cnv and trunked on the 396 that I can on the 996.

I have some questions:

1. Do the freescan files for both the 996XT and 396XT have 996 as the "type" of file or should the 396 file have the file type as 396? The files saved from programming the 396 show up as 996 file types.

2. If so should you be able to upload a file saved from the 996XT to the 396XT scanner?

Any ideas as to why I cannot seem to upload the new system to the 396XT? I compared the setting on the 996 files that work on the 996XT scanner to the files I uploaded to the 396XT scanner and they look the same.

I'm stumped... but of course being new to this that is not saying much

Thanks in advance for any help in trying to receive the new systems here in Clark County Ohio.

Tim

My first guess would be tha tthe BCD396XT is not running current firmware. We're releasing new firmware soon (hopefully this afternoon), but the older version is in the attachment links at the bottom of the firmware update page (http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate).

Is the firmware up to date in the 396?
That's the only cause I can think of.

Well, that or you don't have a setting correct
in the 396 file.

If you don't care about what is in the 396,
you can read the 996 and write to the 396.

Yes, the file extensions are the same for both.

Is it possible the 996 is hooked to an external antenna and the 396 is on it's own antenna? Do you have the attenuator turned on on the 396?

Check on Monday for the file

Update from UPMan on the RR thread.

****
I have the update in my hot little hands...and spent the better part of the afternoon trying to get our new updater configured correctly so that I could issue it. Unfortunately...looks like a Monday release.Two pieces of good news, though:

When it is issued, you'll see that the new updater is just dumb simple (well, for you...as you can see, on the back end it has me a bit challenged right now). If you've updated a BC125AT, you've already seen it in action. You just tell it which scanner you have, which version you want to apply, and then hit "start." No need to cross your eyes and hit 4 buttons while tying your shoelaces to get it into update mode.

If you have a HomePatrol-1, the release is available right now. So, if you really want the update today, rush out and buy a HomePatrol-1 tonight! Then, cruise over to the other thread before discussing that one, though, lest the thread pollution get any thicker than it already is.

<http://forums.radioreference.com/1886772-post50.html>
****

HomePatrol-1 v2.04.01 Released.
Improves audio when receiving digital transmissions on Simulcast (also called Linear Simulcast Mode, or LSM) Repeaters.

The release date is _Monday_.
So as in the many last firmware updates the download site(s) will be
overwhelmed for a couple days to the point you wont be able to get it.
As in the past if some one gets it upload it to the group FILES section
as has been done before by others and myself?

Thanks to all for the information and suggestions. I will try the firmware upgrade to see if that helps and also look at the other suggestions to make sure I have everything set correctly.

The radio is new, I just got it through Amazon a few weeks ago in anticipation of the move from conventional to the OHIO MARC system so I don't know how up to date the firmware is, I just assumed it would be current.

It is on the same antenna as the 996 so it should be ok on signal strength.

I did try downloading the file from the 996 and uploading it to the 396, still didn't work so it may be a firmware issue...

I'll post again after I try the firmware and other suggestions...

thanks again for the suggestions.

for some reason their site is EXTREMELY slow, even on a normal day. I wish they would update their server or something. But not complaining here, just saying...
Maybe after someone gets it, they can put it up on the forum files section here. If that is OK with the boss (UPMan)
Happy New Year everyone,

I am thinking of replacing my Radio Shack pro 97 with the Uniden BCD396XT.

The neat thing about the Pro 97 is that I can separate various counties by banks. Can something similar be done with the 396xt?

Also which computer program should I choose?

Yes. Every system is its own "system" in the scanner. You can have up to 500 systems programmed into the scanner. You can assign any of 100 System Quick Keys (SKQs) to a system (or Site for trunked systems) and quickly turn on/off scanning for a system/site or group of systems/sites by entering the SQK.

Thats what I have done with the BCD396XT,, set it up the same way as my old pro96

different bands for different users , using the Talkgroups up as the deciding factor as to which band or quick key.

I use Freescan, but thats my choice, your mileage may vary....

Yes, you can separate Counties and much more. Most if not all the programming software packages have trial versions, try them and then you decide.

Freescan at http://www.sixspotsoftware.com/products/freescan is a good programming package. ARC XT PRO at www.butel.nl is a good paid package.

Not only can you do that, as others have mentioned, but if you have a city that has multiple trunk system types, you can put them "on the same button" (same SQK) and enable/disable them both at the same time. You can't do that on the 97.

that's what I'm hoping too.
I have a screen reader that I use and that site is a bit slow so it makes my screen reader go nuts.
Is there any way i could ask that the file be uploaded to the files section along with the new BC VUP utility?
Thanks

7174. FreeSCAN

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-06 08:55:05 UTC
From: Doug Johnson
Topic: 7174 Message: 7174

Hello All,

I just attempted to update my version of freescan from 2.10 to 2.11.
I downloaded it from their new website Sixspot Software.

When I went to install it on my PC and my virus scanner reported the file had "HeurEngine.ZeroDayThreat"
I then went to their website to report it and went to the "contact us" page.

Once there, the Contact Us page said "Come on really? Come on....Save your email for something else."
I think that this is a joke, because if this company was serious about their business, they would be open
for feedback, comments etc on their software.

I have had no problems with this software up until now, it has been good and reliable.

If your out there Sixspot Software, please take note. I suggest you fix your "Contact Us" page.

Regards,

Doug

Based on what I read in their forum, they prefer to do software
support in their forum rather than by individual emails.

Bob...

7176. Re: 396XT/996XT problem?

Yahoo group: BCD396XT (2011 — 2014)

From: nz8j
Topic: 7157 Message: 7176

I checked the firmware and it is at 1.10.0, so I would assume it should work fine, but still can't get it to operate like the 996XT for receiving the local Clark County Ohio Sheriff frequencies that utilize the OHIO MARC system. The 996XT programmed just fine using Freescan.

I tried using the same Freescan file that worked on the 996XT to upload to the 396XT and it still won't work.

Any suggestions as to why the exact same file won'twork in the 396XT that works in the 996XT? I checked the block to erase all systems and settings before uploading to each radio and the 996 works and the 396 doesn't.

I'm sure it's most likely something simple, but my lack of experience with anything other than conventional systems doesn't make it obvious to me, it's getting frustrating. :)

I'd appreciate any other help/suggestions..

Thanks
Tim

At least with FreeScan you CAN get support unlike that program that comes from the Netherlands where there is zero support from email or any other means.
Assay however does a fantastic job support wise with FreeScan and if he prefers a forum to email that's fine with me.... at least he supports his software!

I agree.

I tried to help them understand how to better their software to make it easier for the blind and the guy got huffy about it with me.

So I just assume not deal witht hat so don't bother to make anymore comments.

Based on what I read in their forum, they prefer to do software support in their forum rather than by individual emails.

" HeurEngine.ZeroDayThreat"

HeurEngine.ZeroDayThreat detections are Heuristic based detections (based on suspicious behavior, but not confirmed to be malicious or clean).

 Most probably what is termed "a false positive"

try using another virus/malware scanner to verify .

      Been using 2.11 since it was released and my virus/malware engines report no issues with the download or file.

7182. P25 scanning

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-06 19:56:27 UTC
From: ericfatherree
Topic: 7182 Message: 7182

My scanner does not seem to be scanning the P25 towers. If I press hold and scroll to that channel it seems to work "sometimes" we have tested it with AWIN Radios and it does not seem to pick up some of the channels listed. I have checked the codes with radioreference and they seem to be the same as what I have programed. When I press scan it scanns my two conv systems. Systems are as followed

AWIN
Conv 1
Conv 2

It will show on the display the conv 1 and conv 2 while scanning.

Thanks in Advance.

Does anyone live in Arkansas and tried getting the AWIN Systems working. They were pre programed in the scanner but ended up deleting them and re programing sites due to no ctrl channel being located. It seems to pick up an ctrl channel now but some of the channels do not ever talk and they should be "Troop G, Nevada Co Dispatch" ect.

Thanks

Is that a P25 system or a Motorola system? If the latter, you need to
program the tables in if it has been rebanded.

Downloaded the updater and did a 396XT.

VERY SMOOTH! Good job Uniden!

One important note: It appears that you must be connected to the internet to do the firmware update as the updater downloades the firmware for the selected device and then writes to the device. The firmware does not appear to be saved on the PC.

You should update to the what is currently being offered from Uniden.Use the latest firmware updating program (v3.00) it is a simple process...If you have a previous version of the updater, uninstall it, then run the setup program for firmware updater v3.00
Just updated two radios...v1.11.01

If Rob is the guy with the payware, I'd take issue. The current release removed the capability to have multiple priority channels in a group of simplex and repeater channels. The previous versions allowed you to do that, as well as Freescan. When they finally got back to me, he tried to tell me that you never could have multiples. If that's the case, someone had better tell my radio to stop doing it. Obviously, not entirely sure of the radio's capabilities. Still haven't heard a response back a month on.

To be honest, the more I use it, the more I prefer the free one.

Anybody trying the new update especially on starcom21 in IL try these settings. As soon as I changed the hidden P25 settings I noticed a huge difference in audio even with the stock antenna. I have my radio set to 7 for the P25 Adjust Mode and 1 for the P25 Adjust level and I am getting audio clearer than I ever have on Starcom towers 101, 102 and 115. Please give it a shot and report back with your findings no matter where you are. This info could be very beneficial to others down the line.

Thanks,

Bob

Yeah that was a very smoothe update.

Still getting garbled transmitions but it's probably because I'm doing something wrong.

Not because of the update.

Plus, I'm in the basement of my house which probably don't make it much easier to see the control chanel.

But it has improved it somewhat though.

Yes, you can update and not lose frequencies, but you should back up
your programming anyway. Read the notes for the update to determine if
it will be of any use to you.

7202. New question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-08 18:10:31 UTC
From: nz8j
Topic: 7202 Message: 7202

I've tried the suggestions offered by some on here but still can't make the 396 copy my local County sheriff.

Maybe I just do not understand nough to ask the right question(s)...

Should a file downloaded from my 996XT work the same on my 396XT when uploaded to it?

when uploading to the 396XT I check the block that says erase all systems and settings and the only other block checked is to resume scanning after uploading.

The 996XT works on all the frequencies I upload and the 396XT works on all systems EXCEPT the new Clark County P25 frequencies.

Shouldn't they both work the same using the same file, is there something else I need to do to the 396XT to make it work properly?

I updated the firmware this morning to 1.11, no difference.

Thanks

The 396XT and 996XT should behave the same using the same file. I use the same exact file in FreeScan to program both of mine. I guess it could be different in the other software programs but I don't have any experience with them.

One thing to check is the status of the System Quick Key (SQK) if you have one assigned to the Clark County system. It's possible that it is enabled in the 996XT and disabled in the 396XT. At least in FreeScan, I can upload a system without uploading the SQK status.

The same issue can happen with Group Quick Keys if you have any assigned within the System, so make sure they are also enabled in the 396XT.

From: Uniden UPMan
Topic: 7202 Message: 7204

They program virtually identically. The only other settings I can think to check are squelch (normally at 2 or 3) and attenuation (normally off).

7205. background light settings

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-08 21:40:43 UTC
From: Glenn
Topic: 7205 Message: 7205

I have a question about setting background light colors. I probably won't use the correct terms, and this may have already been asked and answered, but I thought I'd ask.

I use FreeScan, and I know how to set background light colors, etc. for analog frequencies/channels. My question is, how do I go about adjusting the light settings for systems and talkgroups (NC Viper, for example)? Do I go through the individual "channels" and adjust the settings there?

Also, is there a way to make the background light stay on for the entire transmission, instead of a few seconds?

Thanks.
Glenn
Kill Devil Hills, NC

SWEET update!

No more plugging in AC supply, removing batteries, etc!

Memory flash mode is definitely the way to go. Hook up the programming cable, load BC-VUP, choose com port, and away you go!

Seamless upgrade! Thanks, Paul!

Even better, you can let the updater auto select the correct Comm Port!

That's doubtful that there will be one as the 396XT doesn't have required hardware as previously mentioned in similar threads. Do a search of posts on the subject.

Yes you can set Alert Light and Alert Tone for any TG ID in a trunked system.

I don't think you can make it stay on.

7212. Phase II TDMA?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-09 14:34:54 UTC
From: Michael Sigler
Topic: 7212 Message: 7212

There are systems in the Chicago area that are ramping up for phase II TDMA. Any plans for 2-slot TDMA firmware upgrades for the BCD396xt or 996xt?

The upgrade was one of the easiest upgrades I've done. Other than turning on the scanner, I didn't have press anything on the keyboard. Plus have multiple comports in use on my pc, it was nice not having to search for the 396xt. Auto Detect rocks!

Thank you Uniden!

Mike-KC9NSA

7213. BCD396XT Firmware Update

I did this firmware upgrade on two of my 396XT's, and found

This firmware upgrade not only the easiest upgrades I've done

to these radios, or the other Uniden radios I own, but it is the first

time I can say that the P25 Voice Quality is finally useable for me when listening in on North Carolina VIPER.

Thank you (Paul) Uniden!

Thanks.......and Keep Safe!

7214. Post 396XT Firmware update question...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-10 00:58:32 UTC
From: Lance
Topic: 7214 Message: 7214

I noticed a few users mentioning they simple plugged in their serial cable and ran the firmware updater
without removing batteries, running the radio on AC adapter, and booting the radio without the HOLD + 6 key depressed.
The firmware updater has a window that pops up mentioning having to do the above sequence for flashing the firmware.

Am I missing something here? I'm asking this for the next time a firmware rev. is released...

Thanks,

-Lance

With the new updater you start it plug in the scanner and if needed click on the find scanner and it should work. What version of Windows are you using?

I know a lot of people have been saying how smooth the firmware update for the BCD396XT went, but has anyone had issues with it? Mine is working fine until I click the button to auto-find the COM port and then it can't detect a scanner. I am using the provided Uniden serial cable with a serial-to-USB adapter. What puzzles me most is that the same set up for connecting my scanner to my pc has worked many times when programming my scanner with FreeScan. I have also tried this on 2 different computers. Does anyone have any thoughts? Thanks!!

Suggest that you use Device Manager to find the port used by the USB cable
and then manually set the Comm Port in V-UP3.
I used the standard serial cable with no problems. USB communications with
many products seems to be a hit or miss affair involving the proper
installation of drivers and phase of the moon..

Yes, I have tried using the COM port that FreeScan uses and I have also manually tried all of the other available COM ports showing up in the Uniden update software. It is only giving me a choice of 2 com ports from the drop down menu and I have tried both of them. I also made sure FreeScan was closed... Thanks!!

7232. Backlight question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-11 20:21:18 UTC
From: wolobmp
Topic: 7232 Message: 7232

Hello all.
Just purchased the 396XT scanner and liking it very much. Comming from a Radio Shack and GRE I am liking what I am hearing moreso then the 2 previous model's I have owned.
My question is: when a signal either P25 or analog comes thru while scanning is there a way I can have the backlight turn on, and stay on until the signal disappears? I see you can set the delay time, set the backlight for on all the time, and squelch,(P25 does not use squelch) and keyboard, etc. Not seeing anything where I can have the backlight come on in all modes and stay on until the signal drops. I was able to do this in my previous Radio Shack and GRE hand helds, but through the software only...not via menu within the scanner.
Anyone have an idea if this is possible with this model?
Thank you
Mike

I don't think it is possible, but I leave my BL on all the time.

Also, with squelch, of course P25 uses squelch - just in a different way
than conventional radio. If it helps, think of 'squelch' to be 'when the
speaker makes noise' or 'when the audio amp is active' if you are
technically inclined. :-)

I have mine set to trigger on squelch...

press MENU > scroll to SETTINGS, push the knob inward/down, go SET BACKLIGHT, push the knob inward/down,

go to SET MODE, push the knob inward/down. Now you can scroll thru the options for the backlight...

Yes. Easiest way is use software like FreeScan and you can set different colors for different channels and TGID's too

You can't make it stay on until the signal drops. It times out eventually when you have it set to 'Squelch'

Hello,

Yes I have my backlight set to squelch, but when a P25 signal comes through the backlight is not lit. Also when the backlight does come on it only stays on for a short period of time, even while the station is still talking.
But there is no option that I see within the scanner to active backlight on signal and stay lit until signal drops out. The backlight stays on for a short period regardless if the station is still on the air.
I am not seeing in the software where you can select backlight when signal is present, and stay lit until the scanner resumes scanning.
I was able to specify this in my previous GRE andRadio Shack Digi/Trunking handhelds.

Any ideas? I have also downloaded Freescan and did not see anything different setting then whats within the scanner itself.

Anyone?
Thanks
Mike

Overall I'm impressed with the improvement that the latest firmware provides. It is a noticable improvement when the unit is used in fixed locations and makes some improvement in mobile situations. I find on one local system that there are still locations where the scanner will not decode the digital bitstream, this may be unique to this particular system.

I'm hoping that Uniden will QUICKLY release this firmware for the 996XT.

(PLEASE {PLEASE} PLEASE)

Are you sure the P25 transmission is not triggering the backlight? Is it possible that you are monitoring a trunked system and it's simply that the replies are not triggering it?

Joe-

I was just thinking, like I said, this serial adapter has always worked when I have been working with FreeScan. Could this somehow be different and I should get another one? Or is that a waste of time/money?
Thanks!

Dan Simon wrote:
> so I may just order one online for $10. We'll see. Thanks for the input.

I didn't see a mention what OS your are running and a few other details that would help determine if this is your problem or not.

However, many people have been experiencing problems with Windows 7 and cheap Chinese knockoffs of the Prolific USB serial adapter that you see cheaply available for $10 and less.

A somewhat recent update to the Prolific driver which Windows Update will try to install attempts to detect the non-genuine chips and prevent them from working. This causes a set the situation a cable setup that previously worked is no longer recognized and the com port goes away.

Here's one guide to dealing with Prolific drivers: http://uv5r.99k.org/UV5R-Drivers.html

(for more google for "prolific error 10 windows 7)

NOTE: If you are going to go through the exercise of buying another USB to serial cable, I strongly suggest that you spend more than $10 and find one that is based on the FTDI USB serial chip. FTDI will be in the description of the cable from most reputable places. It will cost $15-25 instead of $10 or less, but you will spend a lot less time doing trial an error with drivers. The better cables also tend to have better voltage level converters which tends to make things more reliable.

Hope this helps,
--Rob

Thanks Rob. I am running Windows XP on the main computer I have been trying this on. I do think that what you mentioned is my problem. My adapter is made by Gead Heads (according to the sticker on it) and I got it a while ago at Fry's for a pretty low price. I think I may go ahead and order this cable that has the FTDI chip. http://amzn.com/B007NN5LB0

Thanks again!

I didn't see a mention what OS your are running and a few other details that would help
determine if this is your problem or not.

However, many people have been experiencing problems with Windows 7 and cheap Chinese
knockoffs of the Prolific USB serial adapter that you see cheaply available for $10 and less.

A somewhat recent update to the Prolific driver which Windows Update will try to
install attempts to detect the non-genuine chips and prevent them from working.
This causes a set the situation a cable setup that previously worked is no longer
recognized and the com port goes away.

Here's one guide to dealing with Prolific drivers:
http://uv5r.99k.org/UV5R-Drivers.html

(for more google for "prolific error 10 windows 7)

NOTE: If you are going to go through the exercise of buying another USB to serial cable,
I strongly suggest that you spend more than $10 and find one that is based on the
FTDI USB serial chip. FTDI will be in the description of the cable from most reputable places. It will cost $15-25 instead of $10 or less, but you will spend
a lot less time doing trial an error with drivers. The better cables also tend
to have better voltage level converters which tends to make things more reliable.

Hope this helps,

Joe,

The P25 does trigger the backlight, however only stays on few short period of time, even while the signal is still present.

The same should be true for conventional operation.

I too would like to see an option where the backlight stays on for the duration of the signal, optionally in the color selected, but there may be patent issues which are preventing Uniden from doing that. I'm not saying there are, but just that this may be the case.

Using FreeScan you can select various colors for each TGID. You need to unselect the check box next to SIMPLE VIEW and then you will see the choices. I thought you could select the time and so on but you can't. You can however select no flash slow flash or fast flash.

All true, but still the color (alert) backlight will only stay on a few seconds. The standard backlight is the same way if set to SQUELCH, and will only stay on the entire transmission if you have it set to INFINITE which has it on all the time.

Ideally, the squelch setting should allow the backlight to be on the entire duration of the transmission (with the alert color on for the first few seconds). As I mentioned before, there may be patent issues involved preventing such operation.

Hello,

Well, I am glad a few others have been able to understand what my question was about. My GRE and Rad.Shack(GRE-clone) had the ability to have the backlight remain on during the whole transmission, thus I thought it was possible on this model. As for patent, I'm not certain if such a thing exisits, but one would that if not, then a simple revision to the software code could change that.

It's a shame this backlight cannot be set to this state...otherwise its a great scanner, I enjoy it moreso then GRE(major case problems)and the RAD.Shack(also case problems).
Thanks to all for the replies.....
Mike

7253. Unusual problem

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-13 18:04:28 UTC
From: JKS
Topic: 7253 Message: 7253

To: Upman, Joe and the resident geniuses

I have encountered an unusual problem during working with the software. Download was successful as was unzipping. However, when I run the program, a popup window tells me it cannot access the internet and has timed out. This occurs even while direct internet connection is operating.
I have tried this on 3 different computers and several different downloads. I have tried it with IE and FireFox. I suspect it may be a setting in my security, etc. I successfully went to the fttp site after reading the extracted files and downloaded the .scn file, but had no where to go without instructions.

Any help would be very much appreciated.

Jim

One thing you could try is disabling (temporarily) your firewall and see
if that is the issue.

If nothing else, and if the old updater is available, you should be able
to use that to load the SCN file.

7256. RE: [BCD396XT] Re: Backlight question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-13 22:25:09 UTC
From: Ron Aubry
Topic: 7232 Message: 7256

You can set the Back light to any color full time in the settings. The alert will only stay on for as long as the squelch is active, or the time you set . You can set each frequency to it's own alert color. Background setting is seperate from the Alert setting.
Alert is only ment as a quick refferance to what your monitoring. Good luck..

Ron,

If you observe the Backlight when set to squelch, it will trigger, but will not stay on for the duration of the transmission.
This is the distinction MCH was pointing out to another user.

On Jan 13, 2013, at 3:25 PM, Ron Aubry wrote:

7258. RE: [BCD396XT] Re: Backlight question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-13 22:43:27 UTC
From: Ron Aubry
Topic: 7232 Message: 7258

I set my Back light to White/ Squelch on my 396xt, and white/ indefinate on the 996xt, and my alert colors are all set to squelch and what ever color i choose for that frequency group Blue for Med, Red for fire, Green for Sherriff, Yellow local PD, and Cyne for HWP. Works great for me...

If you are in need of a usb to serial adapter I would suggest the usb to serial adapter at sewell direct SW-1301. I havd been using it with Windows 7 with no issues.

Take care,
Joey

I had no luck as well on a windows 7 platform but when I ran freescan it worked fine. So I went to a older PC running XP and it worked fine. My thinking is I need to look for the right drivers for windows 7. So maybe see if its a driver that's stopping you from the update.

I had a cheap HL-340 USB-RS232 adaptor, but when I upgraded to windows 7 it stopped working, even with the new drivers from the web page. I bought a new HL-340, and it does work. The older cables are not hardware compatible with the windows 7 drivers.

That depends on the chip set used in the cable. I still use one of the oldest cables and it's fine for any platform as long as they keep updating the driver's :D

I just purchased a 996XT to complement my 396XT.

As a first step, I went to the Uniden web site to download the latest firmware. It isn't there. The support web site is pathetic with the 396XT and 996XT not even listed on the downloads page.

Does anyone have a link to the 996XT firmware page please?

I'm not sure if there have been any updates to the 996XT.

Although there is a chance there will be one similar
to the 396XT update that was released recently.

Just do a search on eBay. There is one there now for AU$12. Comes with
a driver disc.

So I went to a older PC running XP and it worked fine. My thinking is I need to look for
the right drivers for windows 7. So maybe see if its a driver that's stopping you from the
update.

I have had very good success with this adapter in programming scanners and two way radios. Be sure you have the latest drivers. Used by many two-way radio shops.

7278. CTCSS search during scan

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-17 23:19:52 UTC
From: Tom Hayward
Topic: 7278 Message: 7278

I have programmed a number of conventional channels for which I know the frequency but not the CTCSS. I'd like to display the CTCSS (if any) when scan stops on one of these channels. All of these channels are set as Analog NFM. Under Srch/CloCall Opt -> Tone/Code Search, I have CTCSS/DCS Search selected. I'm not seeing the tone when scan stops. Is there something I missed?

Tom

That's because that setting, as the name implies, is for Search and Close Call. For CTCSS/CDCSS SEARCH in a programmed channel, program the tone for SEARCH. If manually programming, set the channel to ANALOG and the next question that comes up with be what to set the CTCSS/CDCSS to. Select SEARCH and the scanner will show any decoded tones/codes. To program a count tone/code in, just hit the ENTER button when it is shown and you will be asked if you want to set the found CTCSS/CDCSS.

Thanks. I've updated each of those channels so the tone value is
"SEARCH". Now I'm seeing the decoded tones.

Wow, I've got ~3 different tone decodes per channel for most of these,
and varying signal strengths to match. I guess that means my antenna
is working well (colinear at 30 ft). They've got these frequencies
really overloaded.

Tom

What band is your collinear for? Or does it have multi-band elements?

I don't see why you couldn't get phase2 from a software update. Digital transmissions is software decoding of data, so the receiver could be the same. Im not sure if Uniden will do a firmware update though, hopefully. GRE just released a phase2 beta firmware upgrade for the PSR-800.

from Unidens wiki parts site:
http://info.uniden.com/twiki/bin/viewauth/UnidenMan4/PartsRequest#edittable1

BCD 396XT There is a black ovular plastic piece that goes under the belt clip and is fastened by the screw(it fits perfectly in that indent under the belt clip) . Is this included in the belt clip pack ? I have misplaced both my belt clip and this piece Hi These are separate items. You would need part numbers:

BCH396T
BCKVOY

To order, please call 800.554.3988.
Thanks

Bob

Try calling Uniden parts: 800-554-3988. When my belt clip broke for my BC346XT (which uses the same belt clip as the BCD396XT), I called them and since my scanner was still under warranty, they shipped me one for free. They will only do that once though, so if you break that one, you'll have to purchase a new one (which I have done twice). Here's a link to purchase one from Uniden: http://www.uniden.com/accessories/black-beltclip-for-hand-held-marine+hand-held-scanner-/invt/bckvoyg/

Did you program it with the same computer software you used to program a 996XT? I had the same problem with my 396XT reading 'BC346XT' and then I figured out that I accidentally used some of the settings from my BC346XT when programming my BCD396XT. If you are using FreeScan (like I was), go into Scanner > Setup Scanner Options... > General > Startup Message. You can change it from there. You can even put your name on it, like I did! :)

7294. Significance of the signal strength indicator when scanning P25 systems?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-20 16:31:45 UTC
From: kc9vzv
Topic: 7294 Message: 7294

This is probably a very simple question, but I am wondering what the signal strength indicator means when scanning the P25 digital systems. I know it (obviously) shows the strength of the radio signals coming in, but when I am scanning the P25 statewide system here, it shows the number of bars that it has even when the scanner is still showing that it is scanning. I am trying to figure out if this is normal or if my scanner is having trouble decoding the digital signals and it is showing a signal coming in, but it can't give me the audio. Any thoughts?

Thanks!

-Dan

It is showing the signal strength of the control channel
it is evaluating to see what talkgroups are active (if any).

Topic: 7300 Message: 7300

first, kudos to uniden for the new firmware updater. ran 100% perfectly on my emulated win7/64bit system under mac osx lion. the only tweak i might suggest is an option to open the updater executable directly from the tail end of the installer--i had to go find it after the installer closed.

to the point of this query: i use arc-xt-pro most of the time (freescan to a lesser extent) and when i upload even a single system to the 396xt it enables all the systems i previously had disabled and i can't find a way to disable all systems simultaneously or to keep arc-xt-pro from doing this. i'm not sure if freescan does it or not. but i feel like there sure be a way to disable all systems after this happens so i can add back in just the few that i usually have enabled. i did searches and looked back through the online 'easier to use' manual for the xt, but haven't yet seen a way to do this.

if this isn't possible, if anyone has a workaround for this i'd appreciate hearing about it as it's a royal pain having to disable about 2-3 dozen systems every time i make a change.

FreeScan allows you to send the Quick Key Status. That's one of the
options when you upload. I can't say if ARC has a similar option, but it
would surprise me if it didn't.

there is a box in the upload dialogue that says something like 'save quickkey status', but that box has been checked. perhaps it's a bug that it doesn't seem to be getting saved, or at least uploaded to the radio.

i'll go back through the arc20 help system and see if i can get more information about how this setting is supposed to work. now you mention it, i do remember that freescan has a page where you can set the status of your quickkeys and that's a very good feature. hopefully arc20 has a similar page of settings buried somewhere i haven't found yet.

thanks,

7304. Uniden Repair

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-23 19:26:00 UTC
From: Jeffry Rehm
Topic: 7304 Message: 7304

Just received my 396 back fom Uniden after four weeks for repair. I would like to know if anyone else has had issues.

Uniden repaired/replaced the main problem I had. (intermitent sound) They replaced the speaker. I also had asked to repair anything they could find. Apparently the keypad needed replacement even though it worked fine. (it did have lots of wear) I also asked for a firmware update. That was not done, even at my request. (my last repair from Uniden they did the firmware update that I requested - 1.08.14)

I am wondering why they would replace something that was working (I do appreciate the repair) but not perform a firmware update that I requested? I prefer not to do the firmware update myself because of the troubled stories I have read and my lack of computer savy. And I am/was willing to pay Uniden to do it.

Sorry if this isn't the best place to vent but I thought I would let it out there for people to know for future reference. I still have a scanner without the latest updates.

What was the charge for keypad replacement ? Did the new keypad improve the
appearance of the unit ? If so, the value of the unit was probably increased.
The firmware update procedure is not difficult to do. Many of the people
that had problems simply don't follow the instructions.
The firmware updates are meant to be performed by the user.

Keep in mind that the latest firmware has a new interface which
is much easier than the old one. The new one is nearly foolproof.

Doing the firmware update is easy now just DL the new updater and start it then plug the scanner in. In five minutes or less it is updated.....
As for changing the keypad they might consider the worn text an issue and since they had it apart why not slap a new one in and save a problem down the road... I'd be happy with what they did. Firmware update or not.

I am just concerned that the last time Uniden had my scanner for repai they updated the firmware at my request. This time they did not.

I also have the rubber grip around the scanner that is falling off and that was not repaired, however, I understand that probably is not an item that can be fixed. (from some postings I have seen)

The work they did was fine. The work they didn't .....

7311. Case Specs?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-01-24 01:34:50 UTC
From: Lance
Topic: 7311 Message: 7311

A Search and Rescue person was considering purchasing a 396XT after seeing mine. He asked what the case is made of as he
is in harsh environments for his work. I could not find the specs on the case for this radio. MCH or others have an idea? High impact
ABS?

Thanks,

-Lance

Doubt you will find actual specs on it but it takes all the abuse I have put it through as dose the 396t (same case) but neither is water proof. Scratched and dinged but no breaks or cracks and it's been through banging on pit walls fences and burned out buildings. :-D

I've brought mine along for some SAR work, but I make sure it stays
tucked away in my chest harness. I suspect the knob on the top
couldn't withstand a drop. The plastic case feels pretty weak, but I
haven't drop-tested it and I figure the electronics would keep working
just fine even if the case cracked.

My biggest concern is frying the receiver. Other posters here will
tell you that a nearby transmitter can fry the receiver. Typically SAR
work involves a high concentration of transmitters.

Tom

I'm pretty sure it's not high impact ABS. But, you could buy a leather case for it that would give you much more impact resistance. I'm pretty sure the case is not MilSpec in any way either.

Are you listening to MARCS or the old low band frequency?

Can you send me via direct email a data file you are
using? Or post it to the FILES section of the group?

It looks like everything is correct. You have the talkgroups in there,
and the Quick Keys are enabled. Do you hear other things on MARCS, such
as OSP?

Well, that tells me you are hearing the system well enough.

Provided you have Group Quick Key 9 enabled, there is no reason
you should not hear ODOT if they are using their radios.

I would surmise that the reason is because they simply are not
that active. I know I rarely hear them active when I'm in OH.

It's not which is correct for the scanner - it's which one is correct
for the system type you are programming. What are you trying to program
(state, county, and user)?

Hello folks.

I've tried on free scan to enable ICall on a P25 system I'm using.

I had 2 people standing in the same room as me using ICall or Private Call
and it never would work on my scanner.

I couldn't hear the transmitions.

Is there a way to enable Icall on p25 asystems? And if so, How do I do it.

I've tried to put in the I0 on Free Scann but it didn't for some reason
work. But what all systems use ICall?

Thanks.

Jerry Mader

First, are you sure they were using I-Call and not talkaround which is a simplex transmission usually on a frequency not used by the trunked system?

OK. I didn't notice this was you, Bruce.

Anything that is not trunked will be Conventional. This includes STAT.

MARCS is a trunked system and is "Motorola Type II".

I think those are the two main ones in your area. I will check later.

There may be some LTR in your area, too, but most will be MARCS (which
you have programmed) or Conventional which is the typical system type.

If it's a Tait P25 system I-calls don't work on the 396XT. I have reported it a few times on here and on radio reference, with no response yet. The transit system in Portland, Oregon makes a lot of use of individual calls.

It sounds like Tait is not adhering to the P25 standard. If not, there is little use reporting it here or RR - it needs reported to APCO. I know a user who got E.F.Johnson radios, and they too were not compatible with Motorola for I-Call. It ends up EFJ wasn't adhering to the P25 standard, but didn't care to fix the problem either.

Stat can show up anywhere on MARCS or conventional. Your county could be on MARCS or there own system.
Also note that MARCS is in the process of rebranding so that could be why your not hearing them

From: John Stark
Topic: 7325 Message: 7336

Do you have tgid's set as priorities? They need to be set individually just like you would a frequency.

Sent from my Verizon Wireless 4G LTE DROID

Bruce <coolbammer29@...> wrote:

7343. Freescan Virtual Control Loses Connection or something

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-04 13:32:57 UTC
From: Scott
Topic: 7343 Message: 7343

I'm sorry if this has been asked before but I couldn't find it in the archives.

For quite a while now, I haven't been able to use FreeScan virtual control.

I can upload and download from the radio fairly well, although I need to make sure I don't upload huge amounts of data at a time because that will cause an error -- like timeout usually I believe.

Virtual control works for a minute at a time or less, but soon stops. The display will say the name of the last thing scanned, but the scanner continues to scan and the virtual control doesn't. I only ever have to click "relink", and then it's fine again for a little while, but then stops again, etc.

I am using a real serial port, not a USB converter. I have the latest version of FreeScan, and I run Windows 7.

I have found information on this group related to establishing a connection, but not to maintaining a stable connection, which seems to be my problem.

Autoscan finds the right com port in very short order and says it's ready to work with it, and like I say uploading and downloading work fairly well -- it's just when I want the connection to stay up long-term -- like virtual control.

Ideas?

Scott

Another possibility... serial port may be going to sleep. Check Windows
power settings.

This could also be related to the 396 not being able to participate in flow control (e.g. xon/xoff). This means the computer controlling and the RS-232C Interface must always be able to take the data coming at it at whatever speed and whenever. Any hold up on the computer end, be it hardware or software related will cause problems.

Rgds Bill Lauchlan.

7350. A better understanding of P25 decoding

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-10 03:13:27 UTC
From: kc9vzv
Topic: 7350 Message: 7350

I am trying to monitor StarCom21 in ILL but I am still (after about 3 months of playing with settings) having issues with my scanner decoding the system. I upgraded my firmware and read through this http://wiki.radioreference.com/index.php/P25_audio_decode_level_adjustment, but I feel like I am missing something obvious because a lot of the transmissions are still garbled. Any thoughts?

Thanks!

-Dan, KC9VZV

Have you installed the latest version firmware 1.11.something (requires Updater version 3)?

Yes I have. I am running 1.11.01, the newest firmware version.

Thanks,

-Dan

Maybe you're in a bad spot or between two towers.

I noticed ur in Geneva, im in Joliet, using outdoor antennas i monitor T113,102,126, the last one T126-Aurora u should be able to hear...T101-Dupage is very difficult to hear in alot of places...Even tho there is a new firmware upgrade if you don't hear the "CC" well ur not gonna hear Starcom Digital....My daughter is in Elgin, in the mobile going thru your town using the RS800 rubber duck T101-Lisle and in some spots i hear T115-Lake Co.....Your town is kind of in between towers.....

Ok. Yes, I have gotten the feeling from some stuff I have read that I am right between towers. What is the best solution for that overall? Or is there one?

Thanks!

get a yagi antenna and point it towards one tower. Make sure it covers that sited frequency range.

IF being between towers and suffering the multi-path dysfunction really is the issue, then you can get a Yagi antenna for the appropriate frequency range(s) and point it at a tower. For example, from Geneva you could point it at the Lisle tower to catch the DuPage and Cook County sites, with the back of the antenna coincidentally pointed at Elburn to catch a Kane County site.

Even this solution becomes complicated because Starcom21 has both 700 and 800 MHz towers. As I recall, all of the Cook South and DuPage towers are 700 megahertz while Cook North and Kane towers are 800 megahertz. Maybe there are 2 different Yagis with appropriate frequency filters in this story!

Also an interesting question is how can you best couple both a multi-band antenna and a Yagi (or even two Yagis) on the same radio so that your very capable BCD396XT does not become limited to being only a Starcom21 scanner.

Topic: 7350 Message: 7359

Directional beams as you put it work great IF installed and used properly. A Yagi antenna is exactly what is called for in the OP's case since they are right between two sites. Using a proper Yagi antenna and coax will get the right results. A lot of people will not properly ground the antenna and or use cheap coax, both of which defeat the purpose of using the yagi antenna. Poor or improper grounding lowers the antennas ability to receive signals and block unwanted signals as much as using poor quality coax affects reception.
I use a yagi and being east of Indianapolis I still am able to receive some I'll Star com sites as well as many Ohio MARCS sites in addition to most of Indiana SAFET sites using the yagi. Some frequencies I can receive three or four different systems on. The antenna is only 25 feet up but it has proper grounding and 50 feet of LMR400 coax. On one frequency If I move the antenna one direction I pick up one site and then turn it 180 degrees I will get a different site yet both sites are almost the exact same distance from me and using the same power. Take the ground off and I don't get much of anything. Put the ground back and the site I am aimed at is nice and clear with no interference from the other site. If I used cheap coax with lousy shielding I'd get the same bad results as signals get through the shield from both sites as well as other signals degrading everything.
In addition I am less than 1/4 mile from a cell tower and have four other cell towers within five miles. Three can be seen from my house. Add in an Indiana SAFET site five miles away that can also be seen from home yet even with all of that I can find the Control Channels for 150+ trunked systems and sites in good conditions using the yagi.
The point being proper installation will do the job the OP needs to hear the site he wants to hear.

What do you consider to be "proper grounding" on those Yagi antennas?

That depends on several factors Including type of soil and wetness of the soil here I have two 12 foot ground rods on each yagi and six on the disc one.

7363. Error on firmware update

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-12 01:38:37 UTC
From: KJ9B
Topic: 7363 Message: 7363

I finally got around to trying firmware update 1.20.13. Upon starting the executable, and following the instructions (batteries out, hold down L/O and 6 when powering up with power supply), and having the data cable (USB) plugged into the scanner, after selecting the COM port, and clicking OK, I get the following error message: "This scanner is not an object for BCD396T. Rewriting is impossible. Please turn off the power and remove the cable."

I know the PC is talking to the scanner because I can transfer programming and control the scanner via FreeScan. I have rebooted the PC and tried again with no change. I'm sure I missed something simple. Can someone point me where I might look.

Thanks in advance.

Ken Bandy, KJ9B

Are you using the latest firmware update program? If so, you don't
have to perform the L/O+6 method - just follow the instructions.

Download the new BCVUP and install it and run it. You don't need to do all the steps you did in the past now.

Sounds like your trying to put 396T upgrade into a 396XT. The new 396XT upgrade has it own installer. Download the installer and it will load the upgrade. No More three finger dancing...

Dohh! Man, I hate when I do that. You were correct, Ron. After selecting the right scanner, and then finding (with a little digging) the right update package, all is good. Thanks very much for the responses.

Ken Bandy, KJ9B

Analogue is fastley going by the way side not sure if this could have even been heard in the first place considering it's distance from any where but yet another service that is now gone and not able to be heard, soon scanners will be a thing of the past for all except people living in the USA or specialised users in Aust.

I have been in Wagga twice over the past months and have had my P25 UBCD 996T with me it is so good to be able to listen to the coppers again in the clear on P25 instead of the crap that we get served up in Melbourne.

Even the coppers in the USA are P25 in the clear and that's the country with the most to loose.

I think part of this Wayne is the technology is making better use of the spectrum by going digital thus allowing narrowband allocations down from 25khz spacing to as low as 6.25khz single voice path using TDMA techniques. The bitch is the proprietary encode/decode algorithms like Mototurbo or Provoice, which scanner manufactures like Uniden do not have rights to. So it's either Analog or APCO P25 for Public Service. For me when aircraft goes digital I will gut my radios and put blinking Xmas lights behind their displays...

No matter what there will always be conventional analog comma. What really gets me is how many people are drawn away from listening to conventional analog just because their area "went digital". I am amazed by how much people here in Indiana miss because of it too. What no one seems to consider too is these digital systems tend to crash a lot. Well just because an area is digital don't toss out the non digital scanners! I still keep all my analog scanners going and its a good thing I do! Even ISP uses some of its low band stuff on occasion and I have heard things there that no one else did because they only listen to the statewide 800 system. During storms and the aftermath of storms having conventional is a must as SAFT gets too crowded and users get busy signals and go back to their analog systems. Even my own county still uses the old system and they do it pretty regularly either because the site went down or because they figure no ones listening to the old channels anymore. So just because everything appears digital doesn't mean there is nothing left on conventional.

Police in Wagga are still using analogue. They are simulcasting on the analogue liaison TGID (10019 I think) as a precursor to switching over to digital. When they switch over, they will encrypt.

Sorry, but I have to take issue with John Stark’s comments about grounding a Yagi. Any Yagi will work with a scanner or hand held tranciever without being grounded. What IS important is that you use good quality coax as John suggests and that the coax braid is properly connected to the yagi and the scanner.

That said, grounding an outdoor Yagi via the mast or a large diameter ground cable should be done for lightning protection, but it won’t affect the Yagi’s performance.

Ground below a Yagi becomes important when the Yagi is close to ground in terms of wavelength. Since scanners are typically working in the VHF/UHF range, ground is typically multiple wavelengths below the antenna so it doesn’t really play a role.

It does become an issue at HF frequencies since the wavelengths are very long and unless one has a very tall tower, antennas are likely to be within a wavelength of ground. Ground reflections and ground absorption then become issues. In any case grounding the Yagi itself isn’t the issue, but the distance above ground.

Subject: Re: [BCD396XT] Re: A better understanding of P25 decoding

Directional beams as you put it work great IF installed and used properly. A Yagi antenna is exactly what is called for in the OP's case since they are right between two sites. Using a proper Yagi antenna and coax will get the right results. A lot of people will not properly ground the antenna and or use cheap coax, both of which defeat the purpose of using the yagi antenna. Poor or improper grounding lowers the antennas ability to receive signals and block unwanted signals as much as using poor quality coax affects reception. I use a yagi and being east of Indianapolis I still am able to receive some I'll Star com sites as well as many Ohio MARCS sites in addition to most of Indiana SAFET sites using the yagi. Some frequencies I can receive three or four different systems on. The antenna is only 25 feet up but it has proper grounding and 50 feet of LMR400 coax. On one frequency If I move the antenna one direction I pick up one site and then turn it 180 degrees I will get a different site yet both sites are almost the exact same distance from me and using the same power. Take the ground off and I don't get much of anything. Put the ground back and the site I am aimed at is nice and clear with no interference from the other site. If I used cheap coax with lousy shielding I'd get the same bad results as signals get through the shield from both sites as well as other signals degrading everything.
In addition I am less than 1/4 mile from a cell tower and have four other cell towers within five miles. Three can be seen from my house. Add in an Indiana SAFET site five miles away that can also be seen from home yet even with all of that I can find the Control Channels for 150+ trunked systems and sites in good conditions using the yagi.

The point being proper installation will do the job the OP needs to hear the site he wants to hear.

Don't forget polarisation. Most, if not all of the signals of interest to people in the group here are going to be verticaly polarised, because that makes it easy to use a simple vertical antenna for mobile stations. That means any Yagi needs to be mounted "on its side", and not "flat" like a TV antenna. The loss caused by this cross polarisation can exceed 20 dB, and the radiation pattern is likely to be all over the place, increasing the likelihood of reflections corrupting the received signal, especially when receiving digital transmissions.

I do it with the talkgroups. I quick-key the fire talkgroups in key 2 and police talkgroups on key 3
they are all on the same trunked system, so Police talkgroups are locked out on key 2 and fire locked out on key 3
just have to enter all the talkgroups in each quick-key

Topic: 7378 Message: 7381

I do the same for a trunked system, arrange the TG's into groups:

1 Police
2 Fire
3 City Services

All my systems whether conventional or trunked have a number that proceeds them in the label field:

1 LA County
2 LA City
3 Palm Springs
1 Police
2 Fire
3 City Services

Same with groups as well. That way when I hit the menu key, and select Program System, the system
list is ordered numerically for fast reference, and trains my mind to call which number I wanted for a specific system
for quick key assignment...

I'm a nerd, your experience may be different (I doubt it) LOL.

Enjoy,

-Lance

7382. Close Call Resolution...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-13 19:41:33 UTC
From: Lance
Topic: 7382 Message: 7382

The other day I tagged a Sheriff mobile unit via close call. Later I went to look up the licensing for the
department and noticed they had a narrowband allocation for the input to one of their repeaters. The frequency
Close Call found was a few khz off from what I found online. So at the time my 396XT was set to 5kHz for 150.8 Mhz and above segment.

So, is Close Call's frequency resolution dependent on what the Band Default step sizes are set to at the time of frequency capture,
or is Close Call's resolution independent of Band Default settings?

Think I'm going to change my setting from 15khz to 7.5 (it was 5.0khz)

Thanks, and hope UPman reads this.

-Lance

7383. RE: [BCD396XT] Re: A better understanding of P25 decoding

Tony --- you are absolutely correct. Most of what we listen to on a scanner is vertically polarized so anyone using a yagi should definitely mount it so the elements are vertical. Personally, I use a discone antenna which is broadband from about 100MHz to 1GHz, vertically polarized and omnidirectional. I have two of them: one at home on a 30 foot mast, and one at the cabin in main just stuck up in a crawl space about 20 feet above the ground. Both work exceptionally well.

Cheers,

Mike Hopkins – K1VLB

On 13/02/13 3:12 PM, Michael Hopkins wrote:

> Sorry, but I have to take issue with John Stark’s comments about grounding a Yagi. Any Yagi will work with a scanner or hand held tranciever without being grounded. What IS important is that you use good quality coax as John suggests and that the coax braid is properly connected to the yagi and the scanner.
Don't forget polarisation. Most, if not all of the signals of interest
to people in the group here are going to be verticaly polarised, because
that makes it easy to use a simple vertical antenna for mobile
stations. That means any Yagi needs to be mounted "on its side", and
not "flat" like a TV antenna. The loss caused by this cross
polarisation can exceed 20 dB, and the radiation pattern is likely to be
all over the place, increasing the likelihood of reflections corrupting
the received signal, especially when receiving digital transmissions.

Close Call detects the precise frequency, but to tune the PLL, it must match the current step, so it will be rounded to the closest step.

7388. Testing antennas

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-16 08:37:54 UTC
From: John L Waller
Topic: 7388 Message: 7388

I have a couple of different antennas for handhelds, is there a good way to test them out to determine which might have the best reception?? Trying to keep track of specific frequencies while testing these antennas is tricky as there is no guarantee as to when they will be transmitting. BTW, I am using Arc-xt Pro software, although I do have freescan if it would help in testing these antennas.

Thanks, for any suggestions,

John Waller

On VHF you can use a NOAA transmitter. On VHF/UHF you can use a paging transmitter. On most bands you can use a trunking control channel.

Or, you can simply use a marginal dispatch channel and listen for a while. But, conditions can affect this setup more.

Of course, being a portable antenna is tough to test because an inch may make more of a difference in capture area than the antenna.

Thanks for the ideas. What is needed is a transmitter the broadcasts at a consistent power, and either 24/7 or fixed predictable intervals. I suppose the ideal would be a transmitter in each of several bands. One problem with dispatch channels, if I am thinking of the same thing, is that different agencies in our operate on the same frequencies so signal strength will vary depending on the location. Of course, the ideal setup would be to use a mast mounted antenna, but I have to clear that with the landlord, plus find a local supplier of mastsJ

Actually, if they are all operating through the same repeater, the output power will be the same no matter what agency is currently transmitting.

And even if they use different transmitters, just make
sure your comparison is based on the same agency.

Different transmitters means different repeaters... although both may be on the same repeater site and the antennas may be on the same tower.

Hi all and thanks for the helpful replies.

When I first powered up the 396 and had only half a day to get it ready for an interstate trip I thought I'd never work it out. However its actually very logical to use and worked very well over my 4000km drive.

Thanks again,

Ross

Hi all.

Is there a way to import info from a CSV file into Freescan?

Thanks,

Ross

Import your CSV file into the Windows Clipboard using CTRL-C, then click the EZ-Grab! button, click COPY FROM CLIPBOARD, select the proper column items, then click the IMPORT INTO FREESCAN button.

I was going to suggest the same thing. Works very well.

7401. Adding TGID in EDACS

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-23 05:38:57 UTC
From: Lance
Topic: 7401 Message: 7401

So, I'm scanning an EDACS system. Well, actually I have it searching (ID Search).
Now if I put the radio on hold on a programmed TGID, and then go to do a direct
entry, the radio asks me what system I want to put it in, but my system is not listed.

Why is that? I shouldn't have to jump out of the system to add a TG on the fly...

Thanks.

-Lance

7402. Re: Adding TGID in EDACS

Yahoo group: BCD396XT (2011 — 2014)

From: David
Topic: 7401 Message: 7402

Doesn't it ask you what "GROUP" you want to store it in?

<http://marksscanners.com/396XT/396xt.shtml#program%20displayed%20ID>

Storing a Displayed ID (in ID Search Mode) Contents
To store a displayed ID into an existing group during ID Search mode, press E/yes.
You will see 'Quick TGID Save?' in the display then press (.)no.
At the 'Select Group' prompt, scroll to the group where you want to store the ID and press E/yes.
After storing the ID, you will be at the 'Edit Channel' menu to complete the settings for the new channel.
If you don't want to edit the channel settings or are done editing the channel, press Scan/Srch to return to scanning.
To store a displayed ID into a 'Quick Save Group' during ID Search, press E/yes.
You will see 'Quick TGID Save?' in the display then press E/yes again.
The scanner stores the ID into a (created) channel group called 'Qck Save Grp' and you will be at the 'Edit Channel' menu to complete the settings for the new channel.
If you don't want to edit the channel settings or are done editing the channel, press Scan/Srch to return to scanning.

Note: If the ID is already stored in the group, 'TGID Exists' Accept? (Y/N)' appears. Press (.)no to return to searching (or search hold) or E/yes to go to the 'Edit Channel' menu.

If u hold on a TG in the System, press "E", the menu for the TG is available, scroll counterclockwise one notch and it says "NEW CHANNEL", u can now add a new TG quickly to the system, then name it etc....Then press scan and it will continue on the system with the new TG....

From: Lance
Topic: 7401 Message: 7404

Let me be more specific. I have a EDACS single site system with plenty of TGID's in it. I put the radio in HOLD, and then I entered a TGID, the radio of course wants to know if it should be Quick Saved, I say NO, then when it presents me a menu of trunked systems, the one I have been listening to does not appear. So, I can't pop the TGID into it...

Bizarre...

When it asks if you want to save it to the Quick Save group say Yes otherwise it thinks you want it saved to another system which is what its trying to do.
The reason is that there are many trunked systems that TGID's can be used by multiple systems and some only want that ID in one of the shstems.

You must not have the "Trunk System in question assigned to a SQK, and no GQKeys as when i do what i posted in post #7303 i just say NO to the "Quick Save" and it gives me a selection of what "GROUP" under the "Trunk System " i want the new TG placed?....

Thanks Dataman,

I do have a SQK, and 7 GQKeys. I think when I enter the TG, it lacked the space between the first to digits, in following the Uniden AFS format.

Scan and Learn.

Thanks to the rest of the group for your input.

7408. Entering EDACS TGID Directly

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-02-26 20:05:46 UTC
From: Lance
Topic: 7408 Message: 7408

How do I insert the dash separator when doing a direct entry of an EDACS TGID. Hitting the (.) does not work when entering the TG in direct entry mode... I simply want to monitor a TG in the same way you would monitor a single frequency by entering it in, and pressing HOLD.

Thanks.

Press HOLD, enter the TGID using [.][.] as the seperator (two dots = dash), then HOLD again.

From: salrios_25
Topic: 7412 Message: 7412

Just got a BCD396XT, trying to get used to the programming. I downloaded freescan to program it, but not sure if I did it correctly. I liv in California so what I did is the following:
I made up a new system, named it Cities. I then added groups to that system and named them after each City that I wanted to monitor. I then placed all the conventional freqs for each city under its respective group and then assigned that group a quick key so that I could monitor,un monitor as needed. I then downloaded some trunked systems but not sure how to assign a quick key to them. Can anyone give me some direction please.
I can upload the file for you so that you can see if correct or where I need to fix.
Thanks!!

The System Quick Key is assigned in each Site for trunked systems.

The Group Quick Key is assigned the same way it is for conventional.

What I do for all Systems and Groups is put a number before the name like this:

1 LACOFD
1 Dispatch
2 Tactical
3 Mutual Aid
4 "Your Group name here"

2 LAX
1 Airline Ops
2 APP/DEP
3 "Your Group name here"

So, if you forget which system uses what quick key, now you can assign the Quick Key to the System number. Same with Groups as well.

#ing meaning numbering. I think that's it for "Tweet Speak"

Hi all,

The gentleman who requested files for Las Vegas has a legitimate request. I don't know why people are so reluctant to share what they have for Systems here. I don't have a 396XT, but shared my 396T files there. I will do the same with HP-1 list shortly.

As for help, use the list to get someone local to help. I have helped some people in the MA and RI area and glad to do, it's much better way to not only help people, but teach them so they don't have to be going to these lists for every little issue.

Are there programming files on radioreference somewhere? I'm not a premium member so I can't download files to freescan directly.

You can copy from the web page and use EZ-Grab to import them.

Joe,

Yeah I'm aware of the EZ Grab thing, was just hoping someone had some pre-built templates. I received an EDACS state police radio codeplug from a radioreference member, and I will start working on building some Clark County and casino files.

7426. cracked case

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-03-06 04:51:52 UTC
From: Glenn
Topic: 7426 Message: 7426

My 396XT now as a small crack in the case, from being dropped or hit with something, I'm not sure which. I noticed it for the first time only because I could see blue light coming through the crack when the led lit up on the display. The crack is located on the upper left rounded corner of the case, between the function/menu button and the antenna, is less than a quarter inch wide top to bottom and lengthwise, is a little less than half the depth of the case itself front to back.

I don't have the piece of plastic that was chipped away when this happened, unfortunately.

I have put a piece of electrical tape over the crack. But, I'm wondering if anyone might know of a better option. I'm worried about taking the scanner out of the house now, because I'm afraid contaminants will get inside the case and the scanner will stop working.

Thanks in advance
Glenn

I would suggest using "liquid electrical tape" It is a gooey substance that comes in a jar with a brush on the cap.

Clean the area with a q-tip and alcohol, or contact cleaner, and apply the "tape" in thin layers.

With a small crack, this should cover your hole. ABS glue (used in plumbing) would also work well. Just apply sparingly so as not to let it drain into your unit.

Both of these should give a waterproof seal.

Hi,

I need some help because whenever I try to open freescan a message pops up and it says that freescan has stopped working the second I click it. Does anyone have any ideas or solutions for this problem? This would be a great help to me because I would not want to have to pay $40.00 just to download some frequencies to my radio. Or do you have any other free software that I can download to my computer to download the frequencies from radio reference to my scanner?

Thanking you in advance for you help, Mike

What operating system are you using? Vista, XP, Windows 7?

Did you download the latest version of Freescan?

Do you have the drivers for your usb to serial cable adapter? assuming you have one.

I'd suggest ordering a new case they are inexpensive and easy to replace.

Using glues as mentioned csm have bad results. The wrong stuff could make the plastic brittle or even melt it.
I think a complete case is less than $15 and definitely less than $20

Make sure you don't have a priority channel on or weather priority on. All those things will make your audio sound choppy as the radio checks the priority channels. .

Date: 2013-03-09 23:38:30 UTC
From: Earl
Topic: 7442 Message: 7442

My favorite BCD396XT got dropped. Normally this has not been a problem but this last time was a direct hit on the volume/select/squelch knob. Selecting is okay, but now when I depress to change the volume I have to press pretty hard.

Does anyone know where I can get a replacement for the switch/volume part?

Thanks,

Earl

Date: 2013-03-09 23:55:55 UTC
From: live2wire65
Topic: 7444 Message: 7444

hi new to the group here. bought my first nightmare radio.
I have had a scanner ever since the old Pro-4a came out and have bought realistic ever since until RS got to good to carry them.
So I guess I have a real learning curve with this radio since I am use to banks and channels and such and the ..... manual, uh that came with it is almost useless to me. (I feel sorry for those without a internet connection)an I can't seem to sit long enough to wrap it all 'round my head.
I think it is a good enough radio IF only I understood it.
I downloaded the BCTool program to program it with the aid of Radio Reference but that just gets me to where I can listen to it. I have no knowledge about the qiuck keys ect and when I first fired it up it was doing Alaska... I am over 2000 miles from there and had no intrest in it's running SO I deleted it then I noticed it was scanning the other 20+ some states..wow, really so I deleted them too. however that didn't solve my problem since I live in one county and work in another I only want it to scan one at a time as to not waste my response time on the signals.
well I guess that is enough ranting and raving..LOL
Can someone tell me how to update the firmware and what is this about deleting the previous one in the "BCSS" directory?

Mark

You probably don't have any previous versions of the update program if you have never performed any updates.
Just go here and follow the instructions explicitly. It's easy.

It is, once you sit down and decide how to set up, whom you wish to monitor..

 If you look at some of the canned programs and look at some of the programming that others use, with Freescan , its pretty much straight forward..

Thanks John, you may be on something, this Freescan seems to be alot closer to the starrsoft programs I was using and still do with my pro-92, 95, 96 and 97 for my analog and some digital needs. however, Kansas is where my mother and mother-n-law lives and they run a different breed of cat and my 96 is the only one that is capable of it however it needs a $5 volume switch and the finals tuned and I don't want to spend $30+ a hour for the same service a could do if I had the parts. also the 96 is the only rebandable radio in the lot.
one other thing that I noticed and I don't know if it is just a bctool thing but I can lock out a tag id and when it runs it shows up like a bad penny I don't have nor do I plan to attach a gps to it however it maybe in the cc (Close Call) settings somewhere that it pulls it back in somehow.

Two thoughts:
1- check the Radio Reference wiki for your county. Sometimes they have some or all of the tones on there.
2- (this is how I got them) email someone from the fire department. Since they use these tones to program their department pagers, they will have them laying around somewhere and they may be willing to give you a copy.

Hope this helps!

Dan

I'd buy a cheap used windows laptop that meets the bare minimum requirements for the programming software of your choice. I believe it will be money well spent.

You could use virtual box (free) or Parallels and buy windows and then you could run all PC programs.

To do it legal it would set u back some but might be worth it.

Yes.

1). Download Virtualbox (free) and install Virtualbox for OSX on your Mac.
https://www.virtualbox.org/wiki/Downloads

2). Grap a Windows XP CD and create a new virtual machine. Once you have installed Windows XP 32bit version, move on to step 3.

3). Download from within your XP machine while it's running, Freescan.
http://www.sixspotsoftware.com/downloads

4). You will need a serial to USB data cable with drivers, and they will need to be installed in XP.

5). Up at the tool bar of Virtualbox you will see DEVICES. You want to click that menu, and click USB. You should see the name of the USB device
detected (this is your data cable driver). You want to select that, so that Virtualbox passes it on as a hardware device to your Windows XP session.

6). Start up Freescan, and ask one of us how to select a com port and then your radio will be recognized by freescan. I don't have my XP session up and
running otherwise I would provide instruction.

As someone else advised, try to obtain a used PC. And go here for a better manual.
http://marksscanners.com/396XT/396xt.shtml

Also, I'm not sure if the firmware updates can be applied from a MAC. Maybe someone else will offer the correct info. on this.

Clark

to keep things simple, try to get a used pc with a serial interface..
USB is nice, but can be a real pain to interface with scanner , without having to buy a USB to serial cable.

As someone else advised, try to obtain a used PC. And go here for a better manual.

Firmware updates are applied from within a Windows environment be it virtual or from an old laptop.

If u have tons and tons of time and patience you could technical program your scanner with only the keyboard.

But boy o boy u will have to seriously devote a lot of time and effort learning the scanner and the systems and be willing to spends days pushing the bottoms and turning the knobs.

vmware and win7 (64bit) works perfectly for me. no need to dig ditches with
a shovel when a backhoe is parked right in your backyard. i used a mac
because it's the most versatile and has been ever since jobs shifted them
to a freebsd base and intel cpus.

I use an old Dell laptop with a real serial port, because it's there and convenient, and I don't have a generic USB to serial dongle. However, I have used a setup identical to yours for programming other radios with different (USB) cables and software.

TigerDirect has great deals on computers that are perfect for scanners. Many of their "off lease" computers have actual serial ports as well as numerous USB ports. I have three of these off lease computers running various scanner software under different versions of windows and they run 24/7, 365 and not a single failure yet and none of these machines cost more than $150 with one on a special at $99. Nice machines and reliable too. Only changes I made was adding memory to each and I swapped video cards in one.

Its a shame, I took 5 Pcs last week to the electronics recycle center for scrapping
 2 had XP on them ,
we have given away to dozens of computers to senior citizens after cleaning personal data
off them.
Before I retired, we had given 200 away. now, when someone at church or in the
neighborhood
wants to get rid of their old computer, I get them and scrub them, if there are no takers.
I take them to the recycle
center to keep them out of the landfill... its a hobby, Can,t store them forever,

 check around. they are out there for free..

Kudos John for being environmentally conscious about old legacy machines,
I feel the same way, and when I run across them, I flush them with zero's and find people who need them.

Hi Richard,

Do yourself and the list a favor. I don’t know where you live, I live in Massachusetts. If you live in the area you can contact me. Get someone in your area who knows scanners to help you. Your experience will be easier, you’ll really learn things and them list will be spared a lot of back and forth.

At the very least, pick someone here and go directly with them.

You’ll get a lot of answers here, some good, some……well, let’s say everyone’s an expert here.

Go local my friend.

Good luck,

Ray

Got another one dropped off here to-day, 800mhz, Windows 2000 Pro,
10 gig HD,, its too slow and limited to be of any good, or waste time
on, about the only thing it would useful for would be to program the scanner or play simple games.. useless for net
so, to the recycle center it goes.....

Would a netbook with 1 GB of memory work? Funny, but I gave a PC laptop to my son and one to my ex before I moved to Oregon. I only have a macbook and now I need a PC. I can get a netwook for a little money. What do you think?

It would, but netbooks have small screens and looking at a matrix of several options does not work well on small screens. For the money, I would look at a used notebook. I say this as someone who owns and has used both for scanner programming.

They work. I have used one the past Coue of years. I do however use a seperate screen at home. I have it connected to a 20" LCD tv that has all kinds of inputs on it and it only cost around a hundred bucks. Have the same screen for my security system too. And once again got them from TigerDirect. Seem to get a lot of things there.

7478. Scan stopped working correctly

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-03-16 05:14:30 UTC
From: derekpwood@ymail.com
Topic: 7478 Message: 7478

I recently bought this scanner from ScannerMaster and they programmed it for me. It is running firmware 1.10. I must have changed a setting but am unsure. The scanning of all the programmed police, fire, etc frequencies is going very slow, some times just stays on one police frequency even though Hold was not pushed, and I am also getting Air, Military Air, Railroad and similar even though I never used to see them. I just want it to work as it did when I got it. Scan through all programmed systems quickly and stop when a communication is heard. Could I have changed one or more settings? Thank you for any help.

Check your squelch setting [FUNC (scroll knob)]. It should be about 02.

For the price of a Netbook, you can run a virtual machine on your Mac. There are several VM's available, some free. Install Windows on your Mac.

I use Win7 and VMware Fusion. The drivers for the programming cable even have Mac versions.

It's the best of both worlds.

Yes, you could have inadvertently changed something. That's why all users should at least, make an effort to learn how to use and program their scanner properly.

Sounds like you may have accidently turned on the close call feature. Hold on any channel and then press the function button and then press the hold button. Keep pressing the hold button until close call is off.

I was just thinking the same thing. Advantage here you would be using the Mac you love. If you wanted to travel and wanted to hook it up to scanner at hotel and also wanted the MacBook forcsurfing, etc you would only need to take the Mac.

Be tuff for a cheap PC to match your Mac Book Pro.

The scanner will do that when close call scan is turned on,
the only fix is to turn off the quick key associated with the bank that
close call scan is set to record
hits into.
The mode is useful when you want to scan close call hits.

Looking into it more, it seems that the Scan is including all of the "Services", like Railroad, Air, etc, into the scan of my programmed systems. How do I remove the scanning of these services? I just want to hear the systems that were programmed into my scanner from the dealer. BTW, I did do a backup of the programmed systems to my computer using the software ARC XT. Thank you for all the responses so far.

You need to lock them out. You can do this via Freescan programming software, there is a section for it.
Have not tried this using ARC XT.
Perhaps other users know of the tab or page where you can do that...

7488. Introduction from Wiscoonsin

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-03-21 17:06:08 UTC
From: Tom
Topic: 7488 Message: 7488

I just joined this group and thought I'd introduce myself. My name is Tom and I live in Menasha, Winnebago County, Wisconsin. Been listening to police scanner for 40 years BUT never a trunked system. Winnebago is in the process of changing over to a trunked system which is forcing me to "grow"! After a couple of weeks of reseaching, my head is spinning! I finally found the Freescan manual and that is starting to make me feel abit less intense!

Anyway, are there some in this group that live in the Neenah-Menasha area that would be willing to share their experience with the Winnebago transfer? I'd like to hear from you either in the group or by e-mail at tmak26@att.net

Now, back to my reading!

Trunking is a little confusing for new scanner enthusiasts at first. The basics are that a lot of users (Talkgroups) share a few frequencies (channels) that are controlled and assigned by a computer.
Go here http://wiki.radioreference.com/index.php/Trunked_Radio_Systems and here http://wiki.radioreference.com/index.php/Trunked_Radio_Systems.

Don't get too hung up on "Digital" compared to Analog as the proper scanner (BCD396XT) will do the work for you.

If you are a paid subscriber to RadioReference.com, you can use FreeScan to import the information and then download that info. to you're scanner.

Are you using a BCD396XT to monitor things now ?

Clark - I haven't purchased a trunking scanner yet. I am still trying to sort through my options. What a headache! I went from considering the RS Pro 106 to the unden 396XT to now maybe the Unden Home Patrol. All the reading about how difficult it is to program has caused me to slow down alot.! The Freescan website gives me some light at the end of the tunnel! In the meantimeI have no police action from Winnebago County and will probably soon loss the fire service as this county continues the change over.

Tom, I've had at least one of every digital trunking scanner on the market. The Home Patrol is the one I like least. It is not as flexible to program or operate as the 396 or the RS. In the car I like to be able to quickly and easily change talk groups or lock onto a talk group when something exciting is happening. It's easy to do when there are physical buttons to press. It can be done by feel. Not so easy with the touch screen on the HomePatrol. You have to look at the screen then scroll through several to get what you want.

Just my opinion.

Actually with the Extreme version the HomePatrol has more versatility than any scanner on the market.

Tom, I've had at least one of every digital trunking scanner on the market. The Home Patrol is the one I like least. It is not as flexible to program or operate as the 396 or the RS. In the car I like to be able to quickly and easily change talk groups or lock onto a talk group when something exciting is happening. It's easy to do when there are physical buttons to press. It can be done by feel. Not so easy with the touch screen on the HomePatrol. You have to look at the screen then scroll through several to get what you want.

Just my opinion.
Larry

I agree with what you said, but the HP is also ideal for new scanner users who are overwhelmed by programming a trunked system, let alone an entire region's systems.

With the HP, they enter their zip code and the range they want to hear, and that's about all they have to do. It's an ideal entry level scanner.

I do wish it had some of the advanced features such as Fire Tone-Out and Close Call.

From: derekpwood@ymail.com
Topic: 7478 Message: 7496

Yes, thank you for everyone's help. I got my scan working fine now. I used ARC-XT to look at the configuration. Under the Services section, I saw that Railroad, Air, and Military Air were not locked out so I changed them and reloaded the new configuration. All is well. ARC-XT is a great program to see all loaded systems and the config of the scanner. Derek

Hey Tom,
I agree with you about the headache I too have been scanning for years and while I am not new to trunking I am new to the uniden way.
be advised if you have had realistic brands and had a programming cable it will NOT work with the uniden BCD396XT it comes with a cable but unless you have a older computer you will have to buy another cable to convert it to a usb and they squeeze you for another $50 with tax of course.
I am a premium radio reference user and I don't know how many of us users have had this problem but I have tried to download and get that it has x amount of talkgroups and if you proceed it will trunicate and only load say 20 and the others lost?
also if someone out there could give me a heads up on the pre-programmed systems say, Kansas for example. how do you keep it from scanning I have bctool and freescan both and short of deleting it which I really didn't want to do so I locked out the talkgroups but it still scans during scan and I don't recall a tick button to control it also on this Id scan/search I noticed it is scanning Kansas as a Id Scan and my home state Missouri as Id Search what gives with that?

Mark

Older computer? I purchased several last year (none this year so far) and they all had serial ports. Again, I will state that the only ones I have that don't have them are an iPad and netbook. Of course, those are missing lots of other features, too, such as a CD/DVD drive, and even USB ports in the case of the iPad (there is a workaround for that, BTW). Some folks have stated that serial ports are making a comeback.

Even if a PC didn't have a serial port, I purchased an adapter for $3 shipped and it works fine. You can also purchase a serial port card for a lot less than $50. There is also the USB-1 option.

As for RR, I've never ran into any limits on talkgroup imports short of the scanner limitations.

For the most part, the preprogrammed systems only have dispatch talkgroups, as there is not enough room to fit all the talkgroups on all the systems out there. The HP-1 is an exception - it has them all. So, for the preprogrammed systems they will allow instant gratification, but not for all the activity.

7499. 396XT Help.. Ahhhh...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-03-22 14:36:03 UTC
From: richard.venneman
Topic: 7499 Message: 7499

I am about to pull my hair out with this scanner. I even ordered the updated manual from Scanner Master and I still can not make heads or tails of this scanner. I want to enter some frequencies to scan.

When I press scan, the Alaska preprogrammed scans. That is all I get.

Here is what I want to do. I have the frequencies for the Oregon State Parks. 159.225 and 159.390. I want to enter them and name those two frequencies and name the group OSP, just as Alaska is named. And then select OSP and scan. No place in the Factory or Scanner Master manual does it say where to do it.

I get all this information, which I would like to learn.But, for a novice, wouldn't be a great idea for a Quick Start section, to take one step by step to do some of the basic functions. Or, is this scanner for experts and not for new users.

Can someone direct me to a site or a help group to help me get started with the scanner. I have a PC but will not have access to it until the Fall. So, what I do I am doing by the scanner itself. I use a MAC, and understand there is NO programming apps for a Mac.

Thanks

Richard,

You at the right place. There may be somebody local to you on this group who could work with you one on one.
It's an awesome radio, and you will get up to speed on using it.

Sounds like you got a manual from Scanmaster. I browsed thru this to get familiar with the features:

http://marksscanners.com/396XT/396xt.shtml

I have a Mac as well, and run Virtualbox (free) to allow me to run windows XP inside of the Mac. Virtualbox: https://www.virtualbox.org/wiki/Downloads

From there I can program my radio and make changes as necessary via Freescan which you can get here: http://www.sixspotsoftware.com/downloads

As I have over 15 years in the Information Technology field, I could do a remote session with you on your Mac and help you get set up. You would need a copy
of Windows XP to load.

Best,

-Lance

Most of the pre-loaded information is obselete by several years. Just delete them.
Using Menu/Program System. Rotated knob on top to desired system, push down on knob and rotate to Delete system.

I just got a 396xt a couple of days ago. Worked fine for the first two days, and then the display started to act up. Has vertical lines in it. Looks like a bar code. Still scans and all, but I can't read the display to make any changes or anything. Did a power off, removed and reinstalled batteries, and did a reset.

Sending it back Monday, just wondering if anyone else had seen this. Did a google search on the issue and didn't get any hits.

The scanner wakes up out of the box scanning the pre-programmed system information for Alaska, System Quick Key 21.

To shut this off press the following keys: [./No] [2] [1]. The scanner will sound 3 quick beeps and display "Nothing to Scan".

To program the scanner start by pressing the Menu key the create a conventional system and name it and assign it to System Quick Key 1. Then create a group in that system and name it and assign it to a Group Quick Key (0-9 or .) If you choose the decimal point (.) as the quick key the group can not be turned on/off via the keypad.

Now enter your frequencies and any subaudible codes (if known).

Press Scan and 1 and you should be scanning the frequencies entered.

Disclaimer: This was done from memory without a scanner in front of me to verify keys etc. It should be enough to get you started.

Milt

Hi

Does anyone know if you use the BuTel software on a system like

PALMETTO P25 can you put in the MOTOROLA P25 and will it work

Thanking you inadvance for your help

You shouldn't have any problems. Palmetto P-25 is a P-25 Phase I system.
Just make sure to use the "P25" system type, not "MOT".

Has anyone here been using the 396XT to monitor Winnebago County's traffic? And. . . would you share your experiences with programming the 396XT for Winnebago Country.

Tom

Tom, I just purchased my first 396XT yesterday. Radio Shack had them on sale for 419.99, which was only a few dollars more than getting it on Amazon.com and having to wait for it.

Anyway, yes I am monitoring the new Winnebago County WI P25 simulcast system on the XT. Previous to that I was listening to it on my PRO-96, but that radio has some alignment problems. I downloaded the trunked system to the scanner with FreeScan via RadioReference.com, but I've since tried and purchased ARC-XT Pro, which I like a lot better than FreeScan. The system downloaded ok to the laptop and uploaded ok to the XT and took right off on the XT. I've since changed some of the talkgroup names to be more to my liking. I will say that the audio quality of this system on the XT leaves a lot to be desired. Although far from perfect, the audio was somewhat better on my PRO-96. But it's readable. I did go into the hidden menu (hold down "Hold" and turn scanner on) to adjust the P25 decode level down from 50 to 11. Not sure if that's optimum for this system or not. I haven't had a chance to play with that some more.

If you are programming it by hand on the scanner itself, I'm not familiar enough with that process yet to be of much help, but there are plenty of others here that know a lot more about this radio than I do.

Mike

Might be. Download the updater from Uniden's website and perform the update using that. That way you will make sure you have the latest.

The new updater does not require a file download/load or certain keypresses to enter update mode - it takes are of everything automatically.

P25 Simulcast Systems seem to be giving scanner enthusiasts problems. Here in Los Angeles, a new systems is being brought online and many of us are having problems.
It's this one http://www.radioreference.com/apps/db/?sid=7492.

I have a BCD396XT, a BCD996XT and a PRO 197, all with the latest firmware and the reception is choppy, missing transmissions and just plain awful. With the two XTs, I have adjusted the P25 mode and level with no satisfactory results.
The PRO 197 has no adjustments.

I sure wish I knew what the problem is and if Uniden is working on it. Conventional P25 and other digital systems (such as this http://www.radioreference.com/apps/db/?sid=2856) are perfect.

Do you have the latest update? That fixes most of the simulcast issue. However not every system is set up to spec so if its a new system the fix may actually be that its out of spec and will be tuned up as users go on line. It took two years to lower the user complaints on Indy's system. There are still issues though and some may never be fixed. Don't blame it all on Uniden though as much of if not most of the blame is on Motorola!

Well, first of all, the price was right on FreeScan, but to me it wasn't real user friendly and it didn't display correctly on my puter. Not sure if it needs an earlier version of Java or what the problem is, but the text boxes had words cut off, etc. So, I downloaded the trial version of ARC-XT Pro, and it had a much better and more intuitive layout. To me it was a better written program with added features like bandscan, and a nice graphical representation of all of the systems and groups, with the ability to drag and drop groups and systems wherever you want them.

$70 is a bit pricey, but in the long run it will save me tons of time and frustration.

I haven't gotten that far yet, Tom. I need to do some research on the WI State Patrol, as I know a lot of things have changed with their systems. I still had old VHF freqs in my PRO-96, which still had activity on them at times.

I'll second what Joe said. Very easy to do with the updater he
mentioned. I had the updater downloaded and the XT upgraded in 10 -15
minutes. Just make sure the XT is plugged into power and if you use a
laptop that it's also plugged in. Stopping the upgrade in mid-stream is
a sure way to turn the XT into a brick.

Actually, the blame is usually on the company that installs or maintains
the system. This is usually *not* Motorola, but a local service company.

There are several types of P25 systems, and if the installer/ maintainer
uses the wrong set of specs the system will not function well.

I programmed in all of the State Patrol common freqs and the northeast district dispatch freq (154.935) last night. I'll see what I get as I travel around. I did hear traffic on that channel as late as last week, but it was quite weak.

I'm not sure what this system is all about - *Wisconsin Interoperable System for Communications (WISCOM) <http://www.radioreference.com/apps/db/?sid=6364> *- and I'm not sure if the State Patrol is on there or not. There are no system frequencies listed for Winnebago or Outagamie Counties, but there are for Brown, Calumet, and Fond du Lac. There are talk groups for the WSP listed.

Yes, I do get fire dispatch activity on the Red VHF channel. I read somewhere that the fire depts won't switch over right away.

We should probably take this type of discussion over to the Scan-Wis group, since it's not really related to the 396XT. I don't want to stray too much off topic of the list.

You both are on to something. It appeared like the new Winnebago County WI system was off the air for a while late last night. Today, without any changes to the XT on my part, the traffic on the system is much clearer. Too early to tell, but it seems like the local Moto shop boys did some upgrades or changes last night. Several of us heard a sheriff's deputy cussing out the new radios a few days ago when he couldn't make dispatch hear him after several tries.

Motorola techs do have to oversee all phases of system construction and the settings of the system and they ARE ultimately responsible. They have two Moto techs still in Indy working on the system three years later even though a contractor and city employees do the majority of the work on the system its still the Motorola techs who take the heat and responsibility for the issues.

Hello all.

Like to know what a typical price is on a used scanner, that is a few months old, and has all items that when it was purchased. Scanner is in as new condition.
Thank you
Mike

Topic: 7530 Message: 7531

Between $350 and $450 (depending on how fast you want to sell it).

Used Scanner...hum.
You mean like a Uniden 396XT?
Have you looked on ebay?

Here's one currently bidding at $291 http://www.ebay.com/itm/Uniden-bcd396xt-Programmed-At-Warehouse-/190815885139?pt=US_Radio_Comm_Scanners&hash=item2c6d835753

And this one bidding for $305.00 http://www.ebay.com/itm/Uniden-BCD-396xt-scanner-/271178090771?pt=US_Radio_Comm_Scanners&hash=item3f23794913

You missed a major one. Motorola (or whoever is building the system) designs a system, and if built that way would have worked quite well. However the customer says something like "that's too much money, what can you do for [something like 50 - 75%]". So the project gets hacked a bunch, and what do you know, it doesn't work very well - who would have thunk it???

And in the case of Indianapolis they had signed a contract that stated the system was to have 11 sites. However AFTER the system was built Motorola cried foul and changed the system into a simulcast system because they would have lost money on the deal. As it was the city ended up paying millions in cost overruns. I still have logs of the system when it was first turned on and two months later it became a simulcast system. When each site had its own frequencies things worked much better for everyone. After the change it has been horrible! It is still an oddball system using four CC's two North of 70 and two South but it all shows up as one simulcast system.

I received two for Christmas, one I programmed with Wayne, Macomb, and Oakland County, Michigan, has 2nd Recommended higher db gain antenna, new batteries (Chargeable) three manuals, one Printer printed, one by "Nifty Mini-Manual", and the brand new one Easier to read By Uniden XT Scanner Manuals, last a CD version manual. Original Box, Belt Clip, all package material, perfect working order. I guess I could sell it for $425.... Oh yes, it comes with a padded hard aluminum case.... Really nice for travel and storage. The wife paid well over $475 for it all. It's simply I have two, one from kids, one from wife, wife said keeps kids sell her's if I want to see, not that I have to.... But it's a nice one and comes with toys.... So put the word out. dmcasamer@...

What's your point? Both of those are unsold, so those aren't the sale prices or even reserve prices.

Here's a search with a bunch of results for -sold- listings:
http://www.ebay.com/sch/Scanners-/40979/i.html?_sop=13&LH_Sold=1&_from=R40&LH_Complete=1&_nkw=uniden+bcd396xt

Most of them sold for around $380.

From: Justin D.
Topic: 7543 Message: 7543

Hi all,

I just got this scanner recently. It's a great scanner just having one odd issue that I've never had beore. The problem I'm having is I can't figure out how to get it to 'stop' scanning. What I mean by that is it's constantly scrolling through all the frequencies when I just want it listening to only the agencies I've programmed. Right now I have just a few local police departments programmed via freescan in a single group/site. It was working great for a long time then suddenly my scanner is scrolling through all frequencies and won't just listen for the police departments that I have programmed. I'm still new so I apologize if this sounds like a basic question, been struggling with this for a few hours!

Mike

Sounds like you have one or more of the Custom or Service Searches enabled and unlocked. To lock it (them?) out, press F+L/O, L/O while it is in the search.

If you programmed it using a PC and software, you should lock out the search ranges in the software before you send the programming to the scanner.

yes if you hold down the lockout key TOO LONG (4 seconds or so), the radio will unlock everything and will scan your whole radio. I have 24,750 frequencies in my radio. Takes quite some time to go through all of them, lol

It has been posted that the 396XT does not have the hardware necessary
to decode P25 Phase II. That said, I'm sure Uniden is working on
something, even if it's a new model, that will decode P25 Phase II.

I'm sorta surprised that they haven't announced something already.

Then again, there aren't that many people actually using Phase II yet.
There are several systems that are Phase II capable, but few are
actually using Phase II talkgroups.

I'm also a fairly new owner of a 396XT. I made that same mistake trying
to unlock something and then spent a fair amount of time figuring out
how to lock out EVERYTHING again. One of those awww..c**p moments.
Good learning experience, though.

7549. P25 mode and level

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-02 15:14:29 UTC
From: Mike
Topic: 7545 Message: 7549

Just curious what settings people have for P25 Adjust Mode and P25 Adjust Level who are monitoring newer P25 digital simulcast systems. I'm still having poor audio and errs on our local system and have experimented with various settings without much success. Maybe it's something we just have to live with for now. Yes, I have read the"P25 audio decode level adjustment" post on the RadioReference WIKI and understand the basics of these settings. This post recommends leaving the mode at 3 on the XT. I experimented with that until I got up to a 7, which stopped the decoding altogether, so I put that back to 3. The WIKI post states that a setting of 50 is default for the level setting, but doesn't recommend any other value. Just states that some have had better luck with higher settings.

I have a fairly strong signal level at my home on this simulcast system. I've tried values in steps of 25 all the way up to 200 for the level setting and can't say I noticed any change in the error rates or audio quality. Right now I have the level set at 60 which seems to be as good as it gets. Still error rates up to 60% or more, but averaging around 6 - 30%. While the audio is choppy at times, it is readable for the most part.

Having said all that, I'm just looking for what your best settings are for monitoring your P25 simulcast systems. I realize that each system and each monitoring location will be different, but maybe there is a good average range for these settings other than the defaults of 3 and 50.

Yeah that kind of makes me annoyed. I paid so much to have to pay even more once my county upgrades their system?

Scanning used to be a great hobby for me, when I didn't have to pay so much to keep doing so.

Now you say that they can't add software to make it possible to listen to phase two?

This is crazy! And I can't see why they couldn't say, have us send in the radio say for a nominal fee to put a new chip in it.

I'd be willing to do that or something. But not buy a whole new radio that's nonsense.

The only problem with this is every system will interact differently with each scanner.
So what i have on my scanner may not work for yours on a different system. Heck even people who monitor the same systems might have different settings based on where they live or work. Especially multisite systems as the interference and decoding rates will vary based on the timing of each tower.

Just like AM radios designed and built before FM was discovered. Most current P25 scanners were designed and built before Phase II was finalized, or left Phase II out to keep costs down. My fancy AM/FM AVR won't receive Sirius Radio transmissions. Shucks.

As a tax payer you need to be concerned about what your local agenecy is spending on radios.
If each officer has an APX7000 and each car has an APX7500, and the dog catchers and water utilities are using APX6000 that all adds up quickly.
WHY? The analog VHF and UHF stuff worked great, the 800 analog trunking stuff worked great.
Why do we need all this P25 digital phase 1 and phase 2 crap anyway?

WOW sounds like im having a bad day. LOL
But remember for Uniden this is a business, and for most people scanning is a hobby. So its a pretty small market. At the time of production the Phase 2 stuff wasnt widely implemented and keep in mind licensing cost money per unit. There were no licensing fees back in the analog days, but with digital there, Someone owns the rights to the vocoders and to decode it you have to pay a per unit fee to listen.
Theres a lot that goes into producing and manufacturing a scanner.
Realistically if they did a new / revamped unit every 3-5 years that would keep up with the technology.

Spectrum. You may not live in an area where channels are hard to come by, but I run a public safety & all other municipal services regional trunked system in the Los Angeles area. Channels around here are as scarce as hen's teeth. Everybody wants more channels and there simply are none. In fact Congress wants to take away 24 MHz on T-Band in 10 years. That means make more effective use of the channels that you have. Especially on large systems, trunking makes a huge improvement over conventional. A few months ago was the deadline for narrowbanding on VHF and UHF, and that will buy some time, but the next round of narrowbanding will be required. At least in the public safety world, that will be achieved with P-25 phase 2. That will give 6.25 KHz equivelent bandwidth. In the commercial world, DMR (MotoTRBO, etc), and a couple other formats will meet the 6.25 KHz equivilent bandwidth.

All kinds of stuff modernizes and new hardware must be bought. I'll bet you're not reading this message on a computer with a 286 processor either. How many times have you upgraded CPUs since then?

You expected it to be the latest forever?

Besides, I'm still using my BC780s and even my BC300,
so it's not as if it will be totally obsolete.

In fact, I've had more models made more obsolete due
to the FCC-mandated narrowbanding than new technology.
Where is the outrage against the FCC?

I understand your frustration, but until someone can convince Motorola,
Harris, et al, that making money is a bad thing, there will constantly
be new system types out there, and NOBODY can plan for the
communications technology that will be released in 5 years (or sooner).

It's akin to sending in your Betamax to have it updated to accept BluRays. It's possible, but just not practical. They won't even modify DVD players to accept BluRay and those are much more closely related.

So, you want Uniden to replace a chip, and quite possibly add components (either of which will require a new FCC Type Acceptance - read $$$), and write SW for a modified version of the 396XT, and do that all for less than the cost of a new model that will likely not only decode Phase II but may well have some even more new features the 396 is not capable of. Heck, it may even be smaller than the 396 too!

On the other hand, you can sell your XT and put a hundred or two toward the new unit which would likely cost less than the proposed modifications to the XT. So, that's a win-win situation.

As I mentioned before - just convince the two-way manufacturers that making money is not a good thing, and I'm sure they will stop developing new communications technologies.

Name one Uniden digital scanner that was released post-Phase II release.

Even the HomePatrol (the latest digital scanner) was
released before the P25 Phase II spec was finalized.

There are no crystal balls available for scanner developers.

I was referring to the phrase "or left Phase II out to keep costs down."
I don't believe leaving it out was an option even for the HP.

Even Motorola ended up with systems they sold as "P25 Phase II
upgradeable" which ended up not being upgradeable. I bet they lost a lot
on that. These are the systems sold as X2 since they couldn't use the
P25 Phase II name yet. Turns out the final spec for P25 Phase II was
different than X2. I just wish RR would not combine the two terms, but
that's a different issue.

I don't know about Michigan, though. I heard rumors from a few officers that we might upgrade but not sure yet. Probably not for a long time though. I hope!

I'm willing to bet P25 is also part of the post 911 paradigm, meaning at some point with digital, comes proprietary encryption...

> Spectrum. You may not live in an area where channels are hard to come by, but I run a public safety & all other municipal services regional trunked system in the Los Angeles area. Channels around here are as scarce as hen's teeth. Everybody wants more channels and there simply are none. In fact Congress wants to take away 24 MHz on T-Band in 10 years. That means make more effective use of the channels that you have. Especially on large systems, trunking makes a huge improvement over conventional. A few months ago was the deadline for narrowbanding on VHF and UHF, and that will buy some time, but the next round of narrowbanding will be required. At least in the public safety world, that will be achieved with P-25 phase 2. That will give 6.25 KHz equivelent bandwidth. In the commercial world, DMR (MotoTRBO, etc), and a couple other formats will meet the 6.25 KHz equivilent bandwidth.

I know Uniden stated that the XT series is not. I *think* the same
thing was said of the HP as well, but I'm not positive about that.

Would be cool if they used a DSP that allowed changes in firmware, or more interesting, would be
a community of code writers for the radio, much like the Linux open source movement...

I've been putting that idea forth for years. It would allow virtually anything you can decode on a PC. OpenSky, TRBO, NexEdge... yea, that would be great. But, on the DMR modes encryption is only a mouse click away, so as soon as the word got out that scanners could receive it, <click>...

Right it would too.
But I could see a problem with that because there are systems that uniden hasn't got lisences for and someone would be able to then program that system into a dsp codec and then update it. And I think that's why Uniden won't use something like that. But you're right it would be awesome if they did.

Having own several quality scanners to include the BCD396XT and The GRE PSR 800. Then, most recently enjoying the same frustration many have found with current systems, I down loaded all of the basic to advanced varied scanner applications via my iPhone, which includes seven key apps I really like, repeater apps, and even "HamSphere, and Echo Link", I find very little (I can't find) with regards to any formal scanners system, 800, 900, P25 1 & 2, 140/440 MHz on and on to include the 160-6 HAM Bands at any time on demand with virtually any location, with respect to Police, Fire, Safety to include aircraft. With that said why would I continue to pay $400 plus to listen to traffic I can access currently for only a gran total of $45 per year, and remember much of mine is full communication, Send and Receive!

And can you monitor one talkgroup any time you want or are you restricted to listening to everything that is scanning, and then only what talkgroups are being scanned?

Can you monitor more than one feed, for example from two different counties like you can on a scanner?

What is you want to listen to the local vendor, or an unpopular business that only has a range of a mile? Are there feeds for that?

If there were apps that were truly receivers, I might buy your point, and your point is valid that there are some really useful apps out there. But, if everyone thought the same there would be nobody providing the feeds, and there would be no market for scanners. Then your apps would be dead too.

Douglas,

Can you upload a photo of your Harrison Receiver to the photo section? or send it directly to me since
this is 396XT land.

Thanks!

I truly hear that!!

Scanning (for me any ways) isnt FUN like it was 20 yrs ago..... I just like to listen in for emergency stuff.... Now lets not forget they can ENC any time now at will per conversation !!

its just not ,much fun any more!

"Thy will be done, on earth as it is in heaven" (Matt. 6:10).

Much agreed PATRICK!

However the long and short of it is,, Just one less Scan-Head (ME) im unable to pay 500 every 3yrs for a new rig..

Im 48 and have been scanning since i was 14 yrs old my first scanner was a 4 channel crystal

My first "RIG" was this

http://www.rigpix.com/rs-realistic/realistic_pro4.htm

if you wanted to change channels you bought a new crystal ;-) but it was a beginning

_____
"Thy will be done, on earth as it is in heaven" (Matt. 6:10).

No, no. But with my luck, I wouldn't be surprised. Until and unless a market opens for Phase II monitoring, I can't imagine what else could be added that the XT and GRE's scanners don't already do. Paul sidestepped it when I asked. (I knew he would :)

I couldn't imagine some of the options that ended
up being on the HomePatrol. Yet, there they are.
Well, I could imagine them, but I didn't expect
to see them on a scanner so soon.

As for not commenting, well, you can't
blame Paul for wanting to keep his job.

There is an emerging market for Phase II. A couple
areas are using it already and several others have
their systems ready for it, but are using Phase I
compatibility talkgroups for now. Phase II doubles
the number of voice channels on a system, so it will
be popular in the coming years. One advantage is that
Phase II compatible systems can use Phase I and
upgrade as users buy new radios.

Can you afford to pay $200 every 5 years? If so, just sell your current scanner and put $200 toward the new model. Really, you could say $200 every 10 years because it was about 10 years ago that P25 scanners came out (the last new mode added to scanners). That's only $20/year. And the price of digital scanners has dropped over those 10 years. They were $800 10 years ago. Now they are almost half that. I'm not saying the next model will be $200, but I don't expect a massive increase in this economy.

I would love to have a receiver like we had at work.
all band, all mode, computerized rig that we used to check for RF emissions from the electronics of our product. was used with a Faraday cage/isolation room,
 to make sure that nothing else interfered with the testing.
 the earlier manual model that it replaced costs $42,000, have no idea what the new computerized
model cost..   both receivers were amazing...

Douglas,

Can you upload a photo of your Harrison Receiver to the photo section? or send it directly to me since
this is 396XT land.

Thanks!

I would love to have a receiver like we had at work.
all band, all mode, computerized rig that we used to check for RF emissions from the electronics of our product. was used with a Faraday cage/isolation room,
 to make sure that nothing else interfered with the testing.
 the earlier manual model that it replaced costs $42,000, have no idea what the new computerized
model cost.. both receivers were amazing...

Douglas,

Can you upload a photo of your Harrison Receiver to the photo section? or send it directly to me since
this is 396XT land.

Thanks!

Then, most recently enjoying the same frustration many have found with current systems, I down loaded all of the basic to advanced varied scanner applications via my iPhone, which includes seven key apps I really like, repeater apps, and even "HamSphere, and Echo Link", I find very little (I can't find) with regards to any formal scanners system, 800, 900, P25 1 & 2, 140/440 MHz on and on to include the 160-6 HAM Bands at any time on demand with virtually any location, with respect to Police, Fire, Safety to include aircraft. With that said why would I continue to pay $400 plus to listen to traffic I can access currently for only a gran total of $45 per year, and remember much of mine is full communication, Send and Receive!

I been in scanning over 40 years and I agree with you guys for me scanning is not that great anymore... scanners are on every day but since my city joined IL-Starcom and went complete encryption its really sad....Im retired and turn them on along with my low band rig and try to find enjoyment...There is plenty to hear yet but cannot even hear a accident or fire in my own town....

There are several PC programs that will log.
Which one do you use for programming?
It may support logging.

I've wondered about this, too. I use ARC-XT Pro and when using the Virtual Scanner control it logs the CTCSS or DCS that's programmed with the frequency, but I'm not sure if it can be done or how it can be done to search for a tone on a frequency that doesn't have the tone programmed with it. On my PRO-96, if a tone wasn't programmed with the channel, it could be set to show what, if any, tone was being used by the present transmission.

yes you can monitor both at the same time.

I do just that with a trunk system and aircraft.

The solution is to use Quick keys. Assign your trunk system a Quick Key, lets say 1, and your conventional system a Quick Key of 2.

Read up on the use of Quick Keys here: http://marksscanners.com/396XT/396xt.shtml

Yes, it is. Just scan both systems.

If you mean "both at once" being active on both
channels at the same time, that is not possible.

Hi

I hope someone could help me with my programming problems on my BCD 396 XT scanner. Maybe someone in the Fort Wayne In. area or anyone for that matter. . I subscribed to radioreference for 6 months .My most serious problem at this time is I cannot get my computer to allow me to download freescan. When ever I down load it I get the message freescan has stopped working. I have windows 7. Itseems like a computer problem to me.. And I am not computer savy enough to figure it out. If you could help I would be extremely grateful or refer me to someone who could. Thanks, Mike

Do you have any antivirus software running?
You can try disabling UAC in Windows 7...
Go to the Start menu...and type in the search windows, "UAC" without the quotes
You can disable it from there..
If not email me off-list your email address, and I can send it to you..it's less than 2 MB

Thank you for all that respond. Now that I know that it is possible, my next dumb question is how?
How does one scan two systems at once?
I press Function and turn the Volume knob to select the system I want to hear. Then I push scan. It then scans the one system What am I missing here.
And I am still not sure how the Quick keys work. I assign my trunk system to #9 and my aircraft to #7.
On my display the number #7 never flashes. Just the #9 and my trunk system is the only thing scanning.\.

It sounds like you have the System Hold function activated. Is the HOLD
icon flashing on your screen? If this is the problem, press and hold the
HOLD button until it beeps (about 2 seconds).

Joe is right. I've also had a system and a group locked out by accident
and didn't know it until I had downloaded the systems from the scanner
into ARC-XT and noticed the lockout checked on a system. I've also had
a case where the group for a system didn't have the check-mark in ARC-XT
which basically locked out that group.

Are you using Freescan or ARC-XT for programming? If so, dump your
systems into the program from the scanner and check for systems/groups
on hold or locked out. that's sometimes quicker than using the scanner
to check if you aren't totally familiar with the menus in the scanner.

From: neilbell99
Topic: 7607 Message: 7607

I have a mint condition 396XT for sale, includes box, manual CD, antenna, AC supply, programming cable, SMA-BNC adapter etc. No scratches on display face, works just fine. Reason for selling - I have 4 scanners and only use and need 3! Currently programmed for the SF Bay area. Latest software from Unien has been installed.

Will ship to USA, my e-bay rating is 100% positive. My user name is neilbell. My price is $340 and that price includes shipping. I accept paypal or USPO Money Orders. Anyone interested reply to my e-mail address, not the group list.

Neil Bell, KJ6FBA

From: robert.young11@att.net
Topic: 7609 Message: 7609

I am looking for a good used/new 396xt. Should you have one for sale please contact me.

7610. Please help?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-14 22:15:26 UTC
From: LizR
Topic: 7610 Message: 7610

We purchased the BCD396XT first of all it came with a cord that we had no computers to use it with.
So we purchased the USB cord that goes to this scanner, still we can not download things on here to keep.
What we do download says Quick Save we can't get this to work as it should. Yesterday a uniden dealer said he could "bypass" certain things but that would only let it work like the cheaper scanners work
We spent 500.00for the scanner, then we had to spend 30.00 for the USB plug now we are told we have to buy software in order to make this work! Is this just a waste of money? Is it possible for it to really work without it costing your first born? Your help would be greatly appreciated!
If I have to buy even more items I will just return this to Radio Shack for a refund.
We have been to 6 different Radio Shacks and 1 Uniden dealer for help getting this programmed and NOBODY can help us, can or will you? PLEASE?

It's unfortunate that your PC manufacturers chose to not include a erial port that would cost them less than a buck. But that's not Uniden's fault.

I'm not sure which software package you are using, but it's also not Uniden's, so software issues should be taken up with the software author (although I'm sure there are many people who could help on the list here if you describe the problem and specify the software).

Not sure what would be "bypassed". Maybe he meant scanning a trunked system in conventional mode.

That said, there is free software, so you don't have to buy that.

The fact that 6 Radio Shacks could not help is not surprising. The Uniden dealer should have been able to help you.

Now, where are you, what are you trying to program, and what are you using to try and program it? Also, at what point are you running into difficulties?

A free software program is available here.
http://www.sixspotsoftware.com/
It's call FreeSCAN

Too bad that you didn't find this list before pruchasing this fine scanner.
Many of your concern have been asked and answered.
Yes, Radio Shack prices are usually higher. Many other vendors have it cheaper.
Also, Most Radio Shack dealers and employees have no clue as to the
operation of this scanner.

My guess is that you didn't load the drivers for the USB to Serial adapter cable. We can help you with that, but more information is needed.

First, what type of computer is it?

What operating system are you using?

What is the brand of adapter cable you are using.

As others have noted, Freescan is free. There is another program called BCTool, that has a free version as well. Either one is likely to do what you need. Even better, there is a decent chance that someone on this list might be in your area and can send you some files to start.

If you tell us where you are, maybe someone local to you will respond.

I'm not sure that you'll need to buy more items, but it doesn't sound like you should have to.

Give us more information and we can likely help you.

What we do download says Quick Save we can't get this to work

7614. 73 to all

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-14 23:48:58 UTC
From: kw1b_nc
Topic: 7614 Message: 7614

Regrettably, I have found the BCD396XT simply too complex for me to handle. I was hoping the software FreeScan would be like a spreadsheet, like the popular programs for various Icom public safety rigs, and the Yaesu FT-1800 and the like. I've been able to nicely handle programming the rigs for my town's Fire Police and Emergency Ops Center on the public service land mobile bands, but the 396XT is way beyond my abilities. I was able to "read" the radio, and get the pre-load running for North Carolina -- which channel set appears to be either outdated or inaccurate. I heard one voice for three or four seconds one time once, and that was it for over three days of 24/7 monitoring.

So, with a sigh of sadness, and despite the rig's many, many features, I have returned it along with the car adaptor and the USB-1 cable -- which cable did work, allowing me to "read" the radio's contents.

Leaving group now. Thanks to all the hard work of the people who created and maintian this group.

Sorry it didn't work out for you. All you really need is a paid subscription to radio reference. Then you use free scan to download the systems in the area you are in and the things you want to listen too. Then you send that info to scanner. I also have no clue how to use all the complex features but that don't stop me from listening in to all the police, fire, EMS and much more in my area.

Where are you located,,? if your email address is any indication, appears to be in Maine.

there may be someone near on the group that can assist.   I,ve set up 2 other units here in Ky (besides my own)
 using Freescan, its not that hard once you decide what which systems you want to scan.

What I did, was look at some of the programs that others had set up and placed on RR, and used those as a basis for setting up the program for our own area..

Take a look at freescan , its a start...

John in ky.

7618. Garbled Transmissions

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-15 21:56:55 UTC
From: Tom
Topic: 7618 Message: 7618

I have had my 396XT for less than a week so be kind to me!

I am located in Menasha, Winnebago County, Wisconsin and I use Freescan to program my scanner from the RR database. My concern right now is about the garbled transmissions which come through frequently..

What causes this garble? Do I have something setup wrong? Winnebago County is just changing over to the P25 system so might this be something on their end that needs adjustment. Is there something I should adjust on my end?

In my system setup I have:

Type: P25 Standard
General Options: Use Motorola End Code is checked
Use Motorola Digital end Code is checked

XT Options checked: Enable Analog AGC
Enable Digital AGC

I have watched the RSSI in the Freescan log and I noticed the garbel happens even when the RSSI is above 500.

Sooooo. . . point me in the right direction to elliminate or lessen the garble if that's possible!

Tom
Menasha, Winnebago, Wisconsin

Not necessarily *the* answer, but you might want to try disabling the AGCs. Reason being: If they use AGC on the system, and they very likely do, it will compete with the AGC in the scanner and cause issues.

Is this a simulcast system? Nevermind - I see from RR that it is. No matter how strong a site is, it's never so strong that another site can't interfere with it, so you are likely receiving simulcast distortion. The only real solution is to use an antenna pointed toward the strongest site, or if portable try to put your scanner in a location that only picks up one site.

In addition to what Joe points out do a search if the archives as there are many prior questions about this and there are many causes as well. Some you can deal with and some you can't. But the archives have every possible fix or reason for garbled transmissions.

Thank Joe, I'll turn my AGC off.

One other concern I have is that it seems like at times I will miss the first couple of seconds in their transmission which means that at times I haven't been able to ID the unit calling. Is the anything I can do about that??

Liz,
The only thing left is the optional gps and a cigarette lighter adapter of which you will need if you do much listening away from a 115 vac supply source as if yours is like mine a power hog..I listen about 4+- hrs and the 3 batteries are flat what a real bummer and since it is a special power configuration you won't find it at you rs or wally world.

7626. ID Search Question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-15 23:10:29 UTC
From: K3RWN
Topic: 7626 Message: 7626

I was monitoring the local p25 trunked system and came across something I am not sure about. The system has ten groups. I had all the groups turned off except one of them. When the 396XT was in ID Scan I was only hearing the TGs from the group which was turned on which is what I would expect. However when I did an ID Search I would expect that I would be hearing all TGs on the system, but I am not.

Any ideas?

ID SEARCH will let you hear any TGs that are not locked out or disabled.

ID search only searches radio ID not TG's so it will only show ID's on the group or groups you have active.

Encrypted TGs (that are not locked out or disabled) will still
show on the display (be received) - only the audio will be muted.

From: Alex
Topic: 7610 Message: 7634

Actually you can find an adapter at Radio Shack for the radio. The radio wants 6 volts on the power connector (the specification is molded right into the case under the jack 6V at 800mA). You must buy one of the universal adapters such as the enercell 2500mA adapter (catalog 273-366). One of the switch settings is for 6 volts. It will work just fine. The regulator in the adapter is a switching-type regulator so it will regulate to exactly 6 volts and supply whatever current the load demands up to the regulator's maximum of 2500mA (so in this case it's ok that the radio says 800mA and the regulator says 2500mA, the regulator won't supply more than the radio needs).

The only thing I can make of it is that you are talking about
UID display. ID Search does in fact search TGs on a TRS.

Joe,

I think he's making a distinction between a group or collection of ID's vs a single ID. Seems a matter of language. Whatever.

Topic: 7610 Message: 7638

If you are never going to charge batteries inside the radio, then you don't need an adapter with such a high current capacity.
300ma is plenty to cover current draw with the volume up, and backlight on. Here's an excerpt from Radio Reference Forum:

Ok I took several measurements of the actual current draw with different backlight settings on my BCD396XT. It may help some of you understand how much battery drain there is and subsequent reduction in operating time per set of batteries.
1. Radio on Hold. Low band frequency (highest current draw of all the bands) Audio muted (squelched) No backlight, 163 ma. (other bands were in the 150-160 ma. area)
2. Opened squelch- Audio level 7, 178 ma,
3. Then, put light on infinite. Squelched radio again. I took readings for each color and intensity setting:

COLOR-----LOW-----MED-----HIGH

GREEN-----177-----187-----204
CYAN-------183------202-----233
YELLOW---184-----204-----240
WHITE-------190-----217-----265
BLUE---------177----187------204
RED----------178-----190-----210
MAGNETA-185-----204-----238

So, if you use the green color light on low, it takes about 10% more current. So if your batteries lasted 10 hours with no light they will last 9 hours with a continuous green backlight.If your batteries lasted 15 hours with no light, they will last about 13.5 hours with it on.
And yes, the previous poster was correct. The white light does draw much more current then the others.
Bob

Also, the radio shack right angle adapter plugs that come with the universal power adapter, are NOT exactly spec with regards to the diameter of the plugs
themselves, they are a little loose, which potential could be a problem if you accidentally yanked on the DC cable. I noticed the play in the adapter plug after
buying one from RS. So, I went looking for an exact fitting one.

Radio shack's B plug within the set is loose fitting. FYI.

On Apr 15, 2013, at 5:39 PM, Alex wrote:

> Actually you can find an adapter at Radio Shack for the radio. The radio wants 6 volts on the power connector (the specification is molded right into the case under the jack 6V at 800mA). You must buy one of the universal adapters such as the enercell 2500mA adapter (catalog 273-366). One of the switch settings is for 6 volts. It will work just fine. The regulator in the adapter is a switching-type regulator so it will regulate to exactly 6

volts and supply whatever current the load demands up to the regulator's maximum of 2500mA (so in this case it's ok that the radio says 800mA and the regulator says 2500mA, the regulator won't supply more than the radio needs).

From: Alex
Topic: 7610 Message: 7640

I know you don't need the high current capacity but they didn't have anything with a lower rating listed in the catalog. I brought up the rating only to make sure to point out that it was OK to have the higher rated adapter on the radio. Some people take the written current on devices as an absolute and then spend an inordinate amount of time trying to find something with that exact rating. That's only necessary for very cheap transformer-based AC adapters but almost all new adapters (AC and DC) are switchmode power supplies so the situation doesn't apply anymore. This particular enercell unit is a switchmode supply so as long as the voltage matches and the current is greater than whatever the radio wants, the buyer is good.

It is true that the adapters are not quite right but that's because they're following alternate specs. There are actually two slightly different specifications for coaxial barrel connectors. Radio Shack chose one that will fit reasonably well in both types of specification jacks but the result is a loose fit as you point out. If a person is handy with a soldering iron (or knows one who is) then it's not hard to buy an exact plug and replace the one on the adapter.

In my case I built my own adapter because I wanted greater flexibility. It's a switchmode fixed at 6 volts but has plenty of capacity (about 5 amps) to run the 396 as well as a couple other devices that want 6 volts, too. I have it set up with Anderson power poles so I can plug it into my car (which has a block of Andersons under the dash), a sealed lead acid battery (2.5 Ah, relatively easy to carry and runs the radio for about 12 hours or one of my larger batteries), or to any other car with a lighter plug to Anderson adapter. At my desk at work I have a 12 volt wall wart to feed the regulator. The Uniden wall wart stays at home on the desk there.

on the power connector (the specification is molded right into the case under the jack 6V at 800mA). You must buy one of the universal adapters such as the enercell 2500mA adapter (catalog 273-366). One of the switch settings is for 6 volts. It will work just fine. The regulator in the adapter is a switching-type regulator so it will regulate to exactly 6 volts and supply whatever current the load demands up to the regulator's maximum of 2500mA (so in this case it's ok that the radio says 800mA and the regulator says 2500mA, the regulator won't supply more than the radio needs).

From: K3RWN
Topic: 7626 Message: 7641

I am not talking about Radio IDs but TGs ID. In ID SEARCH the radio should receive any and all TGs that are not locked out, but that is not happening.

Rich

Hi Joe and the group,

I am also a new user and am just get up and going with my new BCD396XT. I've been a long time user of the PRO-106, so I'm having to switch gears a bit.

Sorry to (kinda) jack the topic, but since it has just come up...

Is encrypted audio always muted on the BCD396XT? I'm use to hearing the encrypted audio come thru on the PRO-106 as a garbled transmission. Is the muting user selectable on the 396? (Not that I like listening to the garbled audio, but I'm trying to determine if I'm missing some clear comms and it would be helpful to know the audio is unmuted and all transmissions, secure and clear, are coming thru).

Thanks,

Paul

Rich,

See my original reply:

ID SEARCH will let you hear any TGs that are not locked out or disabled.

What you are seeing is normal, as you aren't receiving those TGs that
are in disabled groups.

The light has just gone on! So you are saying that if a group is turned off all the TGs in that group are considered locked out. That makes sense, but I have to admit I never thought of them as being locked out.

So ID Search of a system must have all of the groups turned on to actually function properly.

That makes sense.

Rich

I haven't noticed but has anyone mentioned that in a multi-site system(If this involves a multi site system) , a specific TG may not be active on that particular site/tower if a local authorized user is not affiliated. IOW at times one of my local troopers leaves his car radio on a TG on the other side of the state. When he's in this area, I can hear the other side of the state, when he's at work, nada.

My thanks to Joe too! I also monitor the Winnebago County, WI P25
system and have played and played with the P25 mode and level settings
with no real noticeable difference to the garble on this system. The
digital and analog AGC for this system was turned on and I don't really
know why. I turned both off and have noticed a distinct improvement to
the audio on several talk groups of this system. Never would have guessed.

I originally downloaded this system direct from RadioReference.com, so I
wonder if there was something in that download that would have turned on
the digital AGC?

Actually, they are "disabled" if you simply disabled the Group Quick
Key, not locked out, but if they are in a Group that is actually Locked
Out, then they would be locked out, too. TGs can also be individually
locked out if you hit the L/O button when they come up (once for
temporary lockout - twice for permanent lockout).

The theory is that if you know a TG enough to program it,
then it is not something you would need to search for.

Maybe think of ID SEARCH as something to look for new
TGIDs; and if you have it programmed, it's not new.

You're both very welcome. It's something I learned very quickly on
the PRO-96 (circa 2005) when my local TRS sounded "underwater".

The short explanation is that if you have a low signal, the system AGC
will raise it, but the scanner AGC will raise it, too. Of course once
the system raises it, it will be too high and your scanner will then see
the need to lower it. This happens so fast (several times each second),
it creates an underwater or garbled effect. The two AGCs are actually
competing with each other.

I don't know if RR DLs that setting or not - it might be a default in
the software.

Alex,

Where did you source the pin plug for the radio? is it right angle?

Digi tech catalog?

I was trying to source the right angle adapter plug sets that come with these generic AC/DC adapters.

On Apr 15, 2013, at 6:55 PM, Alex wrote:

> I know you don't need the high current capacity but they didn't have anything with a lower rating listed in the catalog. I brought up the rating only to make sure to point out that it was OK to have the higher rated adapter on the radio. Some people take the written current on devices as an absolute and then spend an inordinate amount of time trying to find something with that exact rating. That's only necessary for very cheap transformer-based AC adapters but almost all new adapters (AC and DC) are switchmode power supplies so the situation doesn't apply anymore. This particular enercell unit is a switchmode supply so as long as the voltage matches and the current is greater than whatever the radio wants, the buyer is good.
>
> It is true that the adapters are not quite right but that's because they're following alternate specs. There are actually two slightly different specifications for coaxial barrel connectors. Radio Shack chose one that will fit reasonably well in both types of specification jacks but the result is a loose fit as you point out. If a person is handy with a soldering iron (or knows one who is) then it's not hard to buy an exact plug and replace the one on the adapter.
>
> In my case I built my own adapter because I wanted greater flexibility. It's a switchmode fixed at 6 volts but has plenty of capacity (about 5 amps) to run the 396 as well as a couple other devices that want 6 volts, too. I have it set up with Anderson power poles so I can plug it into my car (which has a block of Andersons under the dash), a sealed lead acid battery (2.5 Ah, relatively easy to carry and runs the radio for about 12 hours or one of my larger batteries), or to any other car with a lighter plug to Anderson adapter. At my desk at work I have a 12 volt wall wart to feed the regulator. The Uniden wall wart stays at home on the desk there.

You must buy one of the universal adapters such as the enercell 2500mA adapter (catalog 273-366). One of the switch settings is for 6 volts. It will work just fine. The regulator in the adapter is a switching-type regulator so it will regulate to exactly 6 volts and supply whatever current the load demands up to the regulator's maximum of 2500mA (so in this case it's ok that the radio says 800mA and the regulator says 2500mA, the regulator won't supply more than the radio needs).

Yes, the plug is right angle. It's Digi-Key CP-2198-ND. Fits very well.

From: David Johnson
Topic: 7626 Message: 7651

It is working normally. Just say you want to look for some new Talk Groups on a system, but one very active talk group keeps coming up (say fire brigade). By locking out the active talk groups, it will only give you new talk groups that aren't programmed, or talk groups that aren't locked out. Basically, it is the same as ID SCAN, except it will also give you unprogrammed talk groups.

Mike, I think having the AGC on or off is selectable in FreeScan during the uploading process.

My thanks to Joe too! I also monitor the Winnebago County, WI P25 system and have played and played with the P25 mode and level settings with no real noticeable difference to the garble on this system. The digital and analog AGC for this system was turned on and I don't really know why. I turned both off and have noticed a distinct improvement to the audio on several talk groups of this system. Never would have guessed.

I originally downloaded this system direct from RadioReference.com, so I wonder if there was something in that download that would have turned on the digital AGC?

Topic: 7610 Message: 7653

Thank you both for this new information and as I said my radio only last about four hours before it starts beeping low battery. I have the MOSWIN and the Missouri Dept of Public Safety in it and have half of the DPS locked out. No priority, no Close Call and no Alert. I got a hit Sunday afternoon on the Moswin for Fair Grove and once in a while I get a hit on the Trp D Base and a hit on the Mobile Repeater 2 for Branson other than that it is in the Battery Save mode if it has one or it is just scanning.
I have burned a pro-92/96 and my 97 boards by trying to charge in the radio
I will not try that again ever and I have the switch set to alkaline.
I have a old Digi-Key catalog but have never ordered from them I know that some companies require a minimum order.
I will say that you have to have at least the 800 ma or at least I get the Illegal voltage.

From: Alex
Topic: 7610 Message: 7654

The Digi-key part number is for a connector only, not a power supply. That was in reply to Lance's question about a properly fitting connector. You would need either Uniden's adapter or the Radio Shack adapter that I mentioned earlier.

800mA is only a current rating not a voltage rating. You would need at least 5.5 volts on the output of your regulator to avoid the Illegal Voltage error. The only place this comes into play is if the adapter you use is rated so low (like 6 V at 100 mA) that the current draw causes the output voltage to sag. The Radio Shack unit won't have that problem since it's rated for over two amps. Uniden's unit is obviously matched to the radio so it won't have a problem either. But anything else you find has to provide enough or it will sag.

7655. Antenna Upgrade

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-22 13:56:57 UTC
From: Tom
Topic: 7655 Message: 7655

I am having trouble pulling in the Wisconsin State Patrol transmissions and am wondering if there is an antenna "upgrade" that will help me? They are using the P25 system. Any recommendations?????

If in a vehicle, Larson tri-band is great. If to replace the rubber duck... There are several tuned for 800MHz. Check Scanner Master.

Hi All,

I have a BCD396XT and listen to 800 trunked public safety channels in a metro area with the stock antennae it came with. Is there a better antennae out there that will get me some better gain as I drive around in the car / and get in and get out of the car?

Thanks,

Sonamatina

Radio Shack 800mhz rubber-duckie antenna is the best I've used. You'll
need a SMA-BNC adapter

7659. Freescan vs. ARCXT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-23 19:48:31 UTC
From: Preston Ward
Topic: 7659 Message: 7659

Hey everyone -

I haven't gotten a BXT396XT yet but am about to get one, so for those of you who have software for it, I'm wondering if I should just get Freescan or if it's worth it to buy the ARCXT Basic, or Pro. I hate to have to shell out another $35 or $70 but if it's really worth it I'll have to. I've never used either so I really don't know anything about them. So what are your opinions on which to get?

Thanks

I don't have a single bad thing to say about Freescan. I use it with RadioReference to program my BCD396XT, and I've recently used the realtime control/logging feature. It does both of these things well.

I say go with FreeScan....does everything Arc does and doesn't cost $70....although a donation would help the author keep up hid excellent work. FreeScans a lot less buggy and getting ahold of the author is easy if you have an issue. Can't say that with Arc as I waited two years after purchasing one of his programs and never got a single reply to the issue. So I stick with what works and if there is a problem Assaf is very responsive.

ARC software has a 30 day trial before it's required to purchase. So after you obtain the BCD396XT, give ARC a try and you can decide for yourself. Of course FreeSCAN is free but the author does welcome any donation.
I use and prefer ARC-XT Pro, mainly because of it logging feature and the layout of the software.

Either one will "get you there", and they are similar in a lot of ways. I had problems getting both Freescan and Pro96Com to display properly on my main laptop and in my haste I spent the $70 on ARC-XT Pro, which works perfectly on my laptop and I've come to prefer it over Freescan. In the meantime, I discovered that my display problems stemmed from having changed my PC's DPI setting from the default 96 to 120 in order to make things on the screen larger for these aging eyes. I set the dots-per-inch back to 96 in my display properties and both Freescan and Pro96Com now display as they should, albeit in somewhat small type.

Freescan is, of course, free. So try it and see how it works for you. ARC-XT has a time-limited and upload-limited trial version, so I suggest you give it a try also and see if it's worth the $$'s for you. To me, ARC-XT Pro is a bit more intuitive and has a cleaner look to it, but that's just me. The virtual control screen in ARC-XT is also larger and easier to see, with great logging options.

I have been comparing FreeScan to both ARCXT and ProScan. I actually prefer FreeScan. ARCXT and ProScan offer a trial period for their programs so you can compare them with FreeScan for yourself. I personally have no use for the extra features that ARCXT and ProScan give.

The best antenna is one designed for the band or bands of interest. For
example, my primary reason for buying my 396XT is to monitor fire
service frequencies here around 160 MHz, so I use a 160 MHz 1/2 wave
whip on the car which works extremely well for my needs. For 800 MHz,
choose a suitable antenna for that band and you'll get great results.

I've only used Freescan, and find it works very well. No issues
whatsoever. I haven't felt a need to investigate the alternatives, as
Freescan does what I need well.

In the car, I have a 2m/440MHz mag mount that works well on all the scanner frequencies, including the 800MHz trunked systems. Several manufacturers make them and I I've used Diamond and others with equal success (the Diamond lasts longer!). Not much left of interest to me on the lower VHF bands (below 50MHz) but the mag mount would likely work better on those frequencies than any hand held antenna.

FYI for portable use, I found the Diamond H77CA works exceptionally well with the scanner. It's about 15 inches long (38cm) and provides some gain over the standard short antennas.

My 2 cents…

Lot of good suggestions here. Personally, I use a cellular telephone
mag-mount antenna that was popular with the old analog bag phones.
About 15" long with an open coil section in the middle. It works great
for 800 MHz systems, and seems to work quite well on VHF and ok on UHF.
These can be found for little or nothing nowadays since today's phones
don't have external antenna connections anymore.

Shame too, , we found traveling out west, that an external cell phone antenna really extends the range
when your away from the interstate corridors.

That'll work. Either cut off the TNC and put on a BNC, or get an
appropriate adaptor to fit your radio.

I would recommend the adapter. That way, when/if
it wears out connector replacement is quick-n-easy.

Same with the connector on the 396 - I use BNC antennas,
so using the adapter means I can replace the antenna connector
that will wear out (the BNC) in seconds and anywhere.

7677. Scrambled police calls - does anything work?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-25 16:10:19 UTC
From: Preston Ward
Topic: 7677 Message: 7677

MODERATOR EDIT: Joplin, MO

My current scanners (Radio Shack Pro 96 & 97) don't pick up calls from my local police dept so I was just about to buy a new BCD396XT but now I'm being told that it won't pick up local police dept calls from the city because they're scrambled. So far I've been told by my local Radio Shack and police dept that a BCD396XT would be able to pick them up; that it would not be able to pick them up; that it would be able to pick up some of them; that it won't pick up any at all because theyre scrambled, and that the calls transmitted on the "main frequencies" can't be heard but others can be.
So I don't know what to believe... Now I'm just totally confused and don't know if I really want to drop five bills on a new BCD396XT and go through the trouble of programming it only to find out it won't work and have to go through the trouble of returning it.

Is there any way to find out if getting a new BCD396XT would work for local city police & fire at all? I still might be willing to get one even if it picked up some transmissions. I live in the city of Joplin, MO, and can pick up the Sheriff calls from the two local counties here just fine (Newton & Jasper), but it's the local police and fire from the city I really want to hear.

This may be a stupid question, but is there anything one can buy that will receive police calls if they're being scrambled? Is it illegal to have a receiver that unscrambles police calls if they're being scrambled, or just not possible to do? Is there some way to find out what kind of system the City of Joplin is using and if it can be heard by any scanner out there?

http://www.radioreference.com/apps/db/?sid=5649

Channels marked with "E" are encrypted and there is nothing you can do to receive them. The rest can be monitored with a BCD396XT.

There are also:
http://www.radioreference.com/apps/db/?ctid=1527

All can be monitored except the one marked TRBO.

Awesome. That was just what I needed to see.
So it looks like I'll be getting a new BCD396XT and you all will have to put up with more beginner-type questions from me ;)
Looks like there are only 3 channels that are encrypted and all the rest in fact are not. I guess when the police told me everything's encrypted and can't be heard that they just didn't want anyone listening in.

I believe that you can use DSD software that can be found online to decode TRBO but you need a very goof performing PC to do it as the program is s CPU hog.
Not sure how or if it works but was told it did.
Of course if the systems encrypted as well you won't hear anything but if its not you should be able to monitor it with DSD.

If its a New P-25 system , such as ours, only the dispatch & fire talkgroups are open, but all tactical and all EMS
talkgroups are fully encrypted, you need to check RadioReference for your area and see what is available to monitor before laying out the bucks for a 396XT

YMMV

A Motorola system sometimes referred to as MotoTurbo. More of a business type system that's trunked.

Sent from my Verizon Wireless 4G LTE DROID

7686. Re: [BCD396XT] The perfect mobile

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-25 21:58:29 UTC
From: Mark Mitchell
Topic: 7657 Message: 7686

Sorry it took so long to respond, I was planning on getting the right angle solderless bnc adapter for that old antenna because it is cheaper than buying a tnc~bnc adapter and I don't have a mobile phone that uses it anymore so cutting it isn't gonna be a problem... I am trying to wrap my mind around the comment about it is easier to change the connector. I haven't priced the sma~bnc adapter that comes with the radio but wouldn't the number of connections add to signal loss even as small as it might be. I just decided to go with the BNC as it is an all around connector beside the pl-359.

Mark ~ Missouri

7687. Scanner stand / Serial to USB cable

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-25 21:58:36 UTC
From: Preston Ward
Topic: 7687 Message: 7687

I have a really nice portable scanner mount made out of thick heavy steel with adjustable knobs at the bottom to set the angle however I want. Problem is, there's no name or phone number or anything on it, so I have no way to get another one. The one at scannermaster doesn't excite me too much, and this one seems OK:
http://www.niftyaccessories.com/HT%20Stand.htm, but I'd prefer one like what I already have. Does anybody have any tips on where to get a nice scanner stand?

Also, I think the price for a serial to USB cable is really high. $30 for a cable makes me feel like I'm getting ripped. I'm not sure which one of these works for the BCD396XT:
http://www.scannermaster.com/USB_Cable_p/01-551038.htm
http://www.scannermaster.com/Uniden_4_Serial_Cable_BC15_95_246_396_996_230_p/01-530894.htm
,
but at Monoprice (http://www.monoprice.com/products/product.asp?c_id=103&cp_id=10311&cs_id=1031104&p_id=3726&seq=1&format=2) they've got what I believe is the same thing for $5.54, or $7.81 shipped. Both have the Prolific PL-2303 chipset. Has anyone here bought a "generic" serial to USB cable for their BCD396XT, or see any reason why the one from Monoprice wouldn't work just the same?

Thanks!

John,

Did you see this post below? Judging from the link, it looks to me like only three channels are encrypted (unless there's something I'm unaware of).

If its a New P-25 system , such as ours, only the dispatch & fire talkgroups are open, but all tactical and all EMS
talkgroups are fully encrypted,   you need to check RadioReference for your area and see what is available to monitor before laying out the bucks for a 396XT

YMMV
                                                John in Ky.

Subject: [BCD396XT] Scrambled police calls - does anything work?

MODERATOR EDIT: Joplin, MO

My current scanners (Radio Shack Pro 96 & 97) don't pick up calls from my local police dept so I was just about to buy a new BCD396XT but now I'm being told that it won't pick up local police dept calls from the city because they're scrambled. So far I've been told by my local Radio Shack and police dept that a BCD396XT would be able to pick them up; that it would not be able to pick them up; that it would be able to pick up some of them; that it won't pick up any at all because theyre scrambled, and that the calls transmitted on the "main frequencies" can't be heard but others can be.
So I don't know what to believe... Now I'm just totally confused and don't know if I really want to drop five bills on a new BCD396XT and go through the trouble of programming it only to find out it won't work and have to go through the trouble of returning it.

Is there any way to find out if getting a new BCD396XT would work for local city police & fire at all? I still might be willing to get one even if it picked up some transmissions. I live in the city of Joplin, MO, and can pick up the Sheriff calls from the two local counties here just fine (Newton & Jasper), but it's the local police and fire from the city I really want to hear.

This may be a stupid question, but is there anything one can buy that will receive police calls if they're being scrambled? Is it illegal to have a receiver that unscrambles police calls if they're being scrambled, or just not possible to do? Is there some way to find out what kind of system the City of Joplin is using and if it can be heard by any scanner out there?

Yep saw that, appears your more fortunate then us, here, all the tac talkgroups, SWAT , detective
are encrypted.   only the dispatch remain in clear

5 TG in the clear, almost 40 TG encrypted

even the on-line feed was disabled, when it was reported that the perps were using smartphones to
monitor the dispatch feed.

Preston,
did you catch the other link that UPMAN sent that had the Turbo in it it
also had a MDT one as well and my guess is that that one also would be
worthless because of the data stream noise.. but on the bright side MOSWIN
is coming on and you will be able to monitor it as well. I am gettting hits
on it for Trp D now and then.

Cheers,
Mark _ Spfld, Mo

Topic: 7687 Message: 7692

Would the stand you are referring to be the Watson QS-300 pictured here:
http://www.radioworld.co.uk/catalog/qs-300_watson_adjustable_desk_stand_mount-p-8606.html
I believe this is no longer available from the manufacture.

The second item is a loaded question. Bottom line
is that it's hit or miss if you get one that will
actually work on your computer. Some people can,
most people can't. Spend the money on the Uniden
cable, download the drivers from Uniden, and save
yourself the potential headaches and wasted money.

For anyone having trouble with the link, check that your browser hasn't attached the comma to the end of the URL. If so, delete the comma.

From: Scott
Topic: 7677 Message: 7694

About the police telling you everything is scrambled:

Years ago before digital scanners, if anything was digital, it was not monitorable on a scanner.

It's possible the officer you spoke with still has this view.

In some ways it's still true. Years ago when digital was first being implemented, analog scanners were fairly cheap -- some less than $100 -- and "anyone" could listen. We do have digital scanners now, but they're not in the price range of the average joe who wants to listen to the cops. You have to be wealthy, a hobbyist, or REALLY interested to shell out the multiple hundreds of dollars for a digital scanner.

Scott

7695. PSR-600 digital trunking scanner for sale

Topic: 7695 Message: 7695

I have a like-new PSR-600 digital trunking scanner for sale. My new car has no place I can easily mount this excellent digital trunking scanner and I will just be using my PSR-500 hand-held unit. The original cost for the PSR-600 was over $500. I have the original box, CD, Scanner and everything that came with it, including the power supply for home use.

Will ship to USA or Canada. Asking $400 which will include shipping and insurance to USA. Make me an offer! My e-bay rating is 100% positive, user name is neilbell. Please reply by e-mail only, not to the group.

Neil Bell, KJ6FBA

I can see Joe's point, especially if you are connecting and reconnecting the antennas several times a day. Personally, I don't like a stack of adaptors/connectors, so I went the route of putting a BNC right on the antenna coax for a cleaner look and as you say, slightly less loss. Now I have a scanner with an SMA connector built in (Which I'm sure Uniden did to save space) so I still need the adaptor on that radio.

On Joe's point though, each time you disconnect and reconnect an RF connector, you slightly degrade the connection points, and also can produce microscopic metal flakes and particles that can build up within the connector surfaces. In my day job, we've proven this with PIM (Passive InterModulation) testing, and our tower crews must now blow out all connectors with high-pressure compressed air before mating them. Not so much a problem on receive-only applications like a scanner, but still a consideration when every micro-volt of signal helps.

Mike

That's kinda what I suspected re: my local cops telling me that everything is scrambled, and that you had to be wealthy, a hobbyist, or *really* interested in what they were saying to hear them. Because I now live in tornado alley and in a place many of you have probably heard about before (Joplin, MO), I really do want to hear what they're saying during those times when there's a tornado close by. When the EF-5/6 hit on May 22, 2011, the most memorable thing I remember hearing was "Where do we put these body parts?" (not that I have a morbid fascination or anything, I just want to know what's going on around here), and I knew if there were radios that worked for the police, then there *had* to be a way to listen in.

About the police telling you everything is scrambled:

Years ago before digital scanners, if anything was digital, it was not monitorable on a scanner.

It's possible the officer you spoke with still has this view.

In some ways it's still true. Years ago when digital was first being implemented, analog scanners were fairly cheap -- some less than $100 -- and "anyone" could listen. We do have digital scanners now, but they're not in the price range of the average joe who wants to listen to the cops. You have to be wealthy, a hobbyist, or REALLY interested to shell out the multiple hundreds of dollars for a digital scanner.

No mine looks more heavy duty than that one. It looks professionally made, but I'm suspecting now it may have been made by someone who made them as a hobby and just doesn't sell them anymore.

Would the stand you are referring to be the Watson QS-300 pictured here:
http://www.radioworld.co.uk/catalog/qs-300_watson_adjustable_desk_stand_mount-p-8606.html
I believe this is no longer available from the manufacture.

The second item is a loaded question. Bottom line
is that it's hit or miss if you get one that will
actually work on your computer. Some people can,
most people can't. Spend the money on the Uniden
cable, download the drivers from Uniden, and save
yourself the potential headaches and wasted money.

Preston,
If the one you have is different could you send a picture of it? I hadn't
really give it any thought about getting or making a stand for my
HT/Scanner until you brought it up now I seem to really be interested.

Thanks,
Mark ~ Missouri

Agreed..LOL
'course I don't expect R/S to ever carry the sma/bnc adapter that is bound to wear out sometime I try not to move mine much. I bought it for a mobile and when I seen it toook only three batteries I was impressed and the size sold/sealed the deal, little did I know then.

MDT is a Mobile Data Terminal in Laymans Terms it is a laptop computer
which can send a complete message in milliseconds, no audio.
MOSWIN is the new Missouri Inter-agency Network that the Highway Patrol is
migrating to as well as other agencies.
TRBO marked as a future dispatch channel. I am too far away to receive
Joplin or Jasper County to know if it truly is still offline or not or if
it is scrambled/encrypted or not ect.

I understand your concerns about the weather and all having had been within
a block of a tornado that touch down out in Kansas about 15 years ago
ripping the back glass out of the vehicle I was in and I caught the wind,
rain and Hail literally for what seemed like forever.
just know that most LEOs use whatever means necessary to communicate and
really I think that everyone was caught off guard that day. there are many
agencies that respond to that kind of situation so the repeaters outside of
the area would have been used and more than likely the inter agency
frequencies were used.
I would go to NOAA and get the same codes for the counties surrounding and
the one you are in that way you aren't caught off guard as easy.
How long have you been scanning the waves? or are you just getting started.

As a added bonus I would add the frequencies for the Jasper County Storm Spotters as well.

Probably made by the Scanner Stand Man (tonsoffun on RadioReference). I can't find his webpage anymore. Had him build several stands for mobile and handheld scanners years ago. One of the best things I did to keep from stacking scanners.

No mine looks more heavy duty than that one. It looks professionally made, but I'm suspecting now it may have been made by someone who made them as a hobby and just doesn't sell them anymore.

Would the stand you are referring to be the Watson QS-300 pictured here:
http://www.radioworld.co.uk/catalog/qs-300_watson_adjustable_desk_stand_mount-p-8606.html
I believe this is no longer available from the manufacture.

The second item is a loaded question. Bottom line is that it's hit or miss if you get one that will actually work on your computer. Some people can, most people can't. Spend the money on the Uniden cable, download the drivers from Uniden, and save yourself the potential headaches and wasted money.

7704. Re: [BCD396XT] Scanner stand / Serial to USB cable

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-27 12:10:59 UTC
From: Preston Ward
Topic: 7687 Message: 7704

Attached are four pics of my scanner stand. This is the one I'd like to replace but couldn't find one that lets me adjust the angle of it as mine does. So I just got one of these: http://www.niftyaccessories.com/HT%20Stand.htm

I went with the genuine USB cable too. I didn't want the potential headaches of getting one that didn't work. I asked for a price match for what Amazon sells them for so the price difference wasn't so bad. Ordered it all yesterday, should be here at the end of next week.

Preston

P.S. I don't know why it looks so dusty in the pics... I wiped it off before I took the pics of it.

Subject: Re: [BCD396XT] Scanner stand / Serial to USB cable

Attached are four pics of my scanner stand. This is the one I'd like to replace but couldn't find one that lets me adjust the angle of it as mine does. So I just got one of these: http://www.niftyaccessories.com/HT%20Stand.htm

I went with the genuine USB cable too. I didn't want the potential headaches of getting one that didn't work. I asked for a price match for what Amazon sells them for so the price difference wasn't so bad. Ordered it all yesterday, should be here at the end of next week.

Preston

P.S. I don't know why it looks so dusty in the pics... I wiped it off before I took the pics of it.

Preston,
If the one you have is different could you send a picture of it? I hadn't
really give it any thought about getting or making a stand for my
HT/Scanner until you brought it up now I seem to really be interested.

Thanks,
Mark ~ Missouri

7710. Butel software

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-04-27 19:47:50 UTC
From: Sean Fitzgerald
Topic: 2630 Message: 7710

Hello to the group,

I have been using Butel's 396XT pro software for a long time. However, now I just reinstalled the newest version and every time I try and download the freq. from my scanner to the program it locks up very quickly. This has also happened in the past but now it won't stop. Does anyone have any comment / experience with this problem? If so, please share the fix with me.

Thanks,

Sean Fitz

I have no idea... Yahoo just wouldn't send them out and I kept getting error messages that it was a problem on their end. Finally I just sent them one by one and it finally worked.

is it because of the picture size?

I once did have that problem, it wasn't the Butel software, the Uniden USB-1 cable was bad.
I purchased this
http://www.tripplite.com/en/products/model.cfm?txtModelID=3914
and problem was solved.

From: Preston Ward
Topic: 7687 Message: 7715

Don't know why I didn't think of that originally before going through all that...
Anyway, they're in the Photos section now.

The Scanner Stands were last made about 4 years ago by Scannerstandman.com He quit making them when he became a Moderator on Radioreference.com Search on RR for more details.

I have two of these excellent stands and they have a slot in the center top so you can slide the Scanner on and it won't slip off.

You have to search Ebay for any chance of getting a Scanner Stand, That's how I got mine.

32 bit or 64 bit version? Some software doesn't work on 64 bit
versions of windows (like Motorola MTS2000 programming software).

Is your Windows 7 machine x64?
I've had some problems with some of the 4.0 .NET updates from MS, and software issues after the update..pretty much my fix was to reinstall the operating system...

It totally screwed up Sentinel for the HP-1 that never got beyond the splash screen

I would check that the drivers for your serial device are up to date.
ARC-XT runs just fine on 64-bit Windows 7, but serial devices need specific
drivers to work properly in many cases.

If you are using the USB-1 cable then make sure you download the 64-bit
drivers available from ScannerMaster and other sites.

If you are using a third party USB-Serial converter make sure that it has
64-bit drivers. Some do not, and you might need to invest in a USB-1 or a
newer converter. I found a IOGear converter that works great in Win7-64 at
Best Buy for $9.95.

I am in the Phillipsburg, New Jersey 08865, Easton, Pennsylvania area.

I need help programming my BCD396XT
When I first got my scanner a few years ago I was able to program it
through RadioReference.
and I am running the ARCXT basic software.
Now I am having nothing but problems. I have even tried the original computer that I did the original programming off of.
Can someone please help me?

Hi,

Although their Tech Support is not the greatest, have you contacted Butel about your problem?. We'll all be glad to waste yours and everyone else's time here with multiple shots in the dark, but Butel might solve it faster.

I admit that their Tech Support may be a little slow, I went into Scanner Master, a while back, for something else and mentioned issues I was having with the HP-1 Butel software and they kind of chuckled.

Kind of slow..... after three years of silence on a number of issues with their software I gave up. It isn't just tech support either. For five years they advertised software was coming soon for one scanner....still hasn't happened and its ten + years.....
Not sure why anyone needs the Butel software anyway as the Uniden Sentinel software dose everything needed just fine.

7730. Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)

We spend 9 months out of the year in a travel trailer as camp hosts. I have a BCD396XT scanner (that I program manually because I only have a MAC) and I want to get better reception.
What antennas do you people recommend as an upgrade to the stock antenna? Eventually, I want to get one for the truck so I can listen while driving, but for now I want to concentrate for one to use in the trailer, since we are going to be stationary for May and June.

Thanks
Richard

For portability, I would recommend the Scantenna. It quickly breaks down
(folds up) to store in a tight space and performs well when extended.

If you're looking for something you can permanently mount on the
trailer, I would say a dual-band ham antenna would work well.

Richard ---

There are several options to improve reception in a trailer:

If it's metal, a mag mount antenna designed for 2m/440MHz amateur use works very well on all frequencies and would be a big improvement over any hand held antenna. It would also be simple to use in the truck as well.

At my cabin in northern Maine, I have a Discone antenna made by Diamond (there are others available as well). It's broadband - 50MHz to 1GHz --- easy to assemble and all you need is a pole to attach to the trailer. I just have mine on the deck in a corner in the loft of the cabin and it works very well. I also use a Discone at home on a 35 foot pole.

There are other alternatives, but I've found the mag mount and discone to be pretty simple, excellent scanner antennas and not expensive..

Good luck.

A discone would be a PITA to assemble and disassemble on a routine basis (or store assembled), and depending on which one it is it might not last long. Also, in my experience none of the discones I've tried can hold a candle to the Scantenna which has "quick clips" that fold back down quickly

From: ccm4181
Topic: 7734 Message: 7734

I've had my BCD396XT for a few months now. I've used a very old computer to program it up to this point with the included serial cable but the computer doesn't work very well. I'd like to get either the USB-1 cable Uniden sales but I've read some people have problems with it. Will it be better to get the USB-1 cable or a serial to USB adapter? If it makes any difference the computer I'd be using it with is running Windows 8.

Scantenna, it has the quick clips, it's rugged, and you can run a dowel rod vertically down the center for extra strength.

Get a serial adapter, but make sure that it doesn't have the Prolific
chip set as they aren't compatible with Windows 8. I've used adapters
with the FTDI chip set and they work fine with Windows 8.

Here is my recommendation for Windows 8. Buy the official Uniden USB-1 cable, and then install the free version of VMware. Then install Windows XP in the VMware interface. I run Freescan in the VMware window (XP Pro) and have had no trouble with the USB cable. If you try to do it with plain Windows 8, you may have a frustrating experience.

I'm looking to get a wideband omnidirectional base antenna too. I'm going to put it 30-35' up. Anyway, I'm considering 4 models... does anyone have any opinions on which one of these might be better?:

ST2 Antennacraft Base Antenna with Kit
http://www.scannermaster.com/ST2_Antennacraft_Base_Antenna_with_Kit_p/34-541241.htm

ST4 Antennacraft Omni Base Antenna
http://www.scannermaster.com/ST4_Antennacraft_Omni_Base_Antenna_p/34-541604.htm
WBD-40 Discone Base Antenna

WBD-40 Discone Base Antenna
http://www.scannermaster.com/WBD_40_Discone_Base_Antenna_p/13-540456.htm

WBV-60 Wideband Base Antenna
http://www.scannermaster.com/WBV_60_Wideband_Base_Antenna_p/13-540457.htm

Ideally, I'd like to be able to pick up one city 75 miles away, but I still want to go with an omnidirectional at least for now.

7739. Re: [BCD396XT] USB-1 vs. Serial to USB Adapter

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-01 21:08:59 UTC
From: Matt Zinicola
Topic: 7734 Message: 7739

the chipset contained within the USB-1 is not supported by Windows 8 (per the excerpt below taken from the document "PL2302 Windows Driver User Manu v1.7.0.pdf"):

You will need a USB-to-serial adapter that contains the PL2303 HX revision D, such as this one:

http://www.amazon.com/gp/product/B00425S1H8/ref=oh_details_o01_s00_i00?ie=UTF8&psc=1

I had tested the USB-1 and found (on my own) that it did not work with Windows 8. I stumbled upon the pdf mentioned above. I purchase the plugable model cited above and found it to work flawlessly under Windows 8.

I hope that helps,
Matt

Document excerpt:

USB Device with below PL-2303 chip versions and their supported OS Family:
Chip Version
Windows 2000 / XP
(32 & 64 bit)
Vista / Windows 7
(32 & 64 bit)
Windows 8
(32 & 64 bit)
PL-2303H Yes Yes Not Supported*
PL-2303HX (Rev A) or HXA Yes Yes Not Supported*
PL-2303X or XA Yes Yes Not Supported*
PL-2303HX (Rev D) or HXD Yes Yes Yes
PL2303TA Yes Yes Yes
PL2303TB Yes Yes Yes
PL2303EA Yes Yes Yes
PL2303RA Yes Yes Yes
PL2303SA Yes Yes Yes
* - PL2303H, PL-2303HX (Rev A), and PL-2303X are EOL and discontinued chips and Prolific will not
provide Windows 8 driver support. New driver versions will show yellow mark (Error Code 10) in Device
Manager for these EOL chip versions under Windows 8. Prolific recommends using PL2303HXD chip

Make sure you put nylon mesh over it or birds will destroy it in no time.

Effective with our next incoming shipment from our supplier, the USB-1 will use the HX rD chipset. We need about 40 Windows 7 and earlier customers to step up and buy the USB-1 we have on hand. :)

Normally I'd say one of the better discones, unless your interests are limited to a specific band. I can comment on your suggestions, as I don't know those antennas.
>
> Ideally, I'd like to be able to pick up one city 75 miles away, but I still want to go with an omnidirectional at least for now.
Unless you're on a decent hill or mountain, your goals may be in conflict. There is generally a tradeoff between gain, bandwidth (as whether it covers a single band or is wideband) and directionality. You're demanding at least 2 of those, if not all 3.

The most likely antenna to get those signals from 75 miles away is a directional antenna cut for a specific band. This focuses the signals from one direction, and utilises all of the elements to contribute to the gain.

Omnidirectional antennas have to try to form a radiation pattern that looks like a pancake, which means it focuses all of its attention on the horizon. But even then, that volume of space is larger than the directional case above, so the maximum possible gain is lower.

Finally, a lot of broadband antennas don't use all of their radiating elements on any given frequency, so these have even less ability to focus the signals. However, that is compensated for by their extremely wide bandwidth. You can get directional wideband antennas (e.g. a log periodic), but their gain is a lot less than a Yagi or other narrowband antenna cut for a specific frequency in the range covered.

It may be that you either have to install 2 antennas and switch between them, or run 2 scanners (maybe one of them can be a cheap scanner).

Or move to a mountain midway between your target areas! ;)

I have been using a directional multi-frequency Yagi-style TV antenna and it picks up fantastic and it's only 50 feet from ground to tip. I live about 60 miles from Madison, and over 75 miles from Chicago and I pick up quite a bit of their radio traffic. It's not crystal clear, but it's there, and I have no difficulty understanding what they're saying. You can pick them up on eBay for around $65. Cheaper alternative perhaps, and gives you the option for directional reception....

If you need directionality and bandwidth, a TV antenna is a good
choice. Still doesn't have the gain of a monoband antenna of the same
number of elements, but there is useful gain from VHF through to 800 MHz
(assuming a VHF/UHF antenna).

7748. Linking GPS to Android?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-02 19:33:45 UTC
From: vbwyrde
Topic: 7748 Message: 7748

Hi,

I found this information:

Connecting Your Scanner

The GPS device must have a serial (RS-232) output, and be capable of outputting standard NMEA-0183 v3.01 compliant location data, and GGA/RMC data sentences at 4800 bps. Make sure that the cable terminates in a female, 9-pin serial connector and you select the correct baud rate (4800 bps) for the serial port.

Could Android razrm could be used to connect to the BCD396XT using:

http://www.brodit.com/product.html?locale=en&id=945021

And this:

https://play.google.com/store/apps/details?id=com.agbooth.usbgps&feature=search_result#?t=W251bGwsMSwxLDEsImNvbS5hZ2Jvb3RoLnVzYmdwcyJd

Would that work? Has anyone tried it? Or is there a better way to do that?

Thanks!

A better way.....buy and use the Uniden GPS Puck.
Why anyone would use a cell phone for this is beyond me....waste of a phone. And when actually using it as a phone you couldn't use it for a GPS for the scanner...
A dedicated GPS such as the one I mention is the only way to go. .I use two of them when traveling....and use the phone for a phone...

From: kwicker
Topic: 7751 Message: 7751

Have had my 396XT for about a month and it is awesome. I passed down a Radio Shack Pro-95 and rebanded my BCT15. I expecially like using the Freescan software to download the same programs in both the 396 and the 15 (no digital yet). If the 396 was bluetooth ready for a earphone, it would be the ultimate scanning machine.

Great info... thanks a bunch! (and to everyone who replied to me)
I guess what I'm thinking now is maybe I should put up a discone for local wiseband scanning and a directional TV antenna or narrowband directional(s) for those signals that are 70-75 miles away which I believe are in 154 and 460 mhz ranges. I think log periodic antennas may be out of my price range though. Is there any reason I couldn't wire two or more antennas together in a splitter and have the signals combine into one cable? Or would it be better to set up two scanners and use two cable runs from the mast?

And then there's the issue of lightning suppression too... like what type of wire to get for a ground wire?, where it's supposed to attach to the antenna(s)?, and if this would be sufficient for in-line protection?

Also, for a 50-60' cable run, is the thicker cable going to be all that noticeable? (I think what I'm talking about is LMR400 vs RG58 -- but don't hold me to it because don't know what I'm talking about here - LOL. It's been over 35 years since I've been into radio stuff and I'm overwhelmed with all the changes. Which brings me to the BCD396XT. Talk about being overwhelmed... I had no idea how complicated this is. Last time I was really in to scanners I was using crystals. The antenna thing I think I can figure out what to do... the Uniden on the other hand, that may be a different story. A lot of the stuff in the manual is like a different language to me...

Thanks again for all the help.

Unless you're on a mountain top with a clear view of the city 75 miles away, it's unlikely you'll get the 460MHz signal, even the 150MHz would be iffy.

TV antennas don't work unless they're mounted sideways. TV is horizontal polarized, mobile radio is vertical polarized.

#10 or larger aluminium is good for ground, but unless you're willing to spend a lot if money on suppression equipment, don't count on "real" protection from a simple ground line. You also need supressors on the lead line. And, of course, a good copper plated 10' grounding stake driven fully into the ground.

A simple splitter to combine two antenna leads for reception usually doesn't work unless you're real lucky with lead lengths. In fact, in many cases, it can make things worse due to line mismatch and SWR issues. Definitely a no-no for use with a transmitter.

A switch is a better way to go.

Putting 2 antennas on a splitter will only work for one specific frequency because of the wavelength of the coax connecting them. You have to use a switch. ----- Original Message -----From: "Don.Curtis@..." >;don.curtis@...;*;*;*;*;*;*

I can't help you with Indana programming as I am in Los Angerles but go here
http://forums.radioreference.com/indiana-radio-discussion-forum/
and post your questions.
Are you new to scanning in general or just that you don't understand the
Uniden Dynamic Memory method of storing data ?

So would a TV antenna need to be pointed at the city 70-75 mi. away (with the smaller elements pointing nearest it, and the longer elements furthest away), or pointed sideways so that the end points of the elements are pointing at it?

Would something like this be OK to use for in-line lightning suppression http://www.amazon.com/gp/product/B004X80NO8/ref=ox_sc_act_title_1?ie=UTF8&psc=1&smid=AAQ3GHQN09UUL , or is this a "you get what you pay for" thing and too cheap and therefore not sufficient?

You mean 10AWG wire? I happen to have a lot of 10AWG speaker wire left over from speaker installations. Would that work?

A grounding rod needs to be TEN feet in the ground? Wow I was thinking like 3 feet would be OK. But 10?! Wow. I don't know how I could even get something like that into the ground. I may just have to resort to keeping the thing unplugged all the time in case a storm sneaks up on me while I'm asleep sometime, and only plug it in when I'm using it and know the sky's clear.

I'm not on a mountain top, in fact I'm in a bit of a bowl, but I have a clear shot for the 70-75 mile signals I was hoping to get. I don't know though... it may be wishful thinking though. And I hate to invest the money into another antenna(s) if it's not going to even be possible to work. As for the local signals, I don't think that'll be much of a problem once I get a discone or something up on a mast.

Thanks,
Preston

Unless you're on a mountain top with a clear view of the city 75 miles away, it's unlikely you'll get the 460MHz signal, even the 150MHz would be iffy.

TV antennas don't work unless they're mounted sideways.   TV is horizontal polarized, mobile radio is vertical polarized.

#10 or larger aluminium is good for ground, but unless you're willing to spend a lot if money on suppression equipment, don't count on "real" protection from a simple ground line.   You also need supressors on the lead line.   And, of course, a good copper plated 10' grounding stake driven fully into the ground.

A simple splitter to combine two antenna leads for reception usually doesn't work unless you're real lucky with lead lengths.   In fact, in many cases, it can make things worse due to line mismatch and SWR issues.   Definitely a no-no for use with a transmitter.

A switch is a better way to go.

Look up a Di-plexer or cross-band coupler like it used with Ham radio.
http://www.aesham.com/duplexers/triplexers/comet-cf-4160k/

They work well, even with a transmitter.

If you have the money, they also make dual band directional antennas.
http://www.mfjenterprises.com/Product.php?productid=MFJ-1768

But a TV antenna turned 90 degrees will work just fine.

It would have to be mounted so the smaller elements are closest to the direction you want to receive. You would also mount it so the elements are vertical (up and down) and not horizonal.

Or, like this looking at it from the side:

```
| |
| | | |
| | | | | | | |
--------------- --> direction you want to receive.
| | | | | | | |
| | | |
| |
```

And lightning rods are usually only 8 feet long, but they should be completely in the ground save for a couple inches.

That's true for a transmitter (technically, it's called diplexing antennas, and I've done it many times, but for a receiver it's a completely different ballgame where SWR and mismatch is much less of an issue. It is possible to have a shorted stub on one leg which nulls out frequencies on the opposite antenna (which is really the effect that diplexing is taking advantage of).

Actually, a commercial diplexer will often be designed to pass one band and attenuate the other. To connect two antennas you would want an antenna splitter only use it 'backwards' - in other words, connect the scanner to the antenna port and the antennas to the receiver ports.

But, using a 'tee' connector will usually give nearly as good results as anything else.

Solid, not stranded wire for the ground.

You say you have a clear shot at the site 70 miles away, but you're in a bowl. Anything in between you and the transmitting antenna, including the curvature of the Earth will block or strongly attenuate signals in the 450MHz bands. Signals in those frequency bands are considered line-of-sight only only.

While under clear terrain conditions, signals in that band can received 70 miles away, if you're in a bowl... I would doubt you could receive it.

I hear Chicago PD from two different antennas, one a discone and the other a yagi. One, the discone is 65' to the top of the discone and the yagi is at 22'. I am located 5 miles East of Marion Co Indiana and 8 miles North of I70. Chicago uses 450Mhz and I can listen to them pretty much whenever I want. Both antennas have LMR 400 coax. As much as anything coax is just as important as the antenna.

If Chicago PD antennas are on top of the Sears tower, that'd make sense. Indiana is pretty flat and the air distance is perhaps 170 miles. And yes, the type of coax used is very important.

I am 60 miles north of denver, but can't receive any signals from Denver but we have a 300' ridge between them & me, but I can receive signals from antennas in the foothills west of Denver because those foothills are about 1800' higher than the city.

I think log periodic antennas may be out of my price range though. Is there any reason I couldn't wire two or more antennas together in a splitter and have the signals combine into one cable? Or would it be better to set up two scanners and use two cable runs from the mast?
You could use the splitters that hams used to separate 2m and 70cm, if
those are really the frequencies you need to monitor.
>
> And then there's the issue of lightning suppression too... like what type of wire to get for a ground wire?, where it's supposed to attach to the antenna(s)?, and if this would be sufficient for in-line protection?
OK, I'm not so much of an expert in this field.
>
> Also, for a 50-60' cable run, is the thicker cable going to be all that noticeable? (I think what I'm talking about is LMR400 vs RG58 -- but don't hold me to it because don't know what I'm talking about here - LOL. It's been over 35 years since I've been into radio stuff and I'm overwhelmed with all the changes. Which brings me to the BCD396XT. Talk about being overwhelmed... I had no idea how complicated this is. Last time I was really in to scanners I was using crystals. The antenna thing I think I can figure out what to do... the Uniden on the other hand, that may be a different story. A lot of the stuff in the manual is like a different language to me...
On UHF, you will definitely notice a difference! Use at least RG-213,
if not LMR-400 or even hardline.

I believe the original poster's desire to reliably intercept typical Public Safety frequencies from 75 miles away is wishful thinking, even with a directional antenna. Also, a lot of what some of us learned in the past about DX reception goes out the window with narrow banding & lower power.

For those who claim to hear Chicago PD from 75 to 150 miles away, I would bet that you do not hear all of the Chicago Police frequencies. Isn't it the case that you hear a few of the Citywide frequencies and not all the district zones? I believe that tremendous antenna elevation and power have a lot to do with that. If you are able to grab the 13 district zones from your location, then I want to know your secret! It is true that one or two of those frequencies can be heard across the lake in Southwest Michigan, but not all of them, and that's because there's nothing but a big, flat (and perhaps somewhat reflective) lake in-between.

For grounding, I am currently installing the L-Com HT-GK400 series grounding kits on my coax. Instructions are to scrape off a small section of the outer insulation, secure the grounding strap around the exposed outer braid of the cable, and then run the ground wire from there to a ground rod. Long copper ground rods are pounded into the ground (requires a step ladder for the initial blows and a big hammer!).

Hi John,
I would like to listen to FWPD, EMS,Allen County Sheriff,Indiana State Police, CB and the Ft Wayne, Int. airport. I can pull up all I want to listen to on Radio Reference but I can't download it into my scanner. i have been told that i need to update my firmware on my BCD396. I would need help.I also can't get my scanner to communicate with Butel software.

This BCD396XT scanner was hardly ever used and is in perfect condition. No marks/scratches/blemishes of any kind. It comes with everything you see in the photos, which is the scanner, antenna, wall charger, belt clip, NiMH batteries and serial programming cable. I don't have the box or manual for it, but if you want, I'll throw in an extra manual I have for the BCD396T model.

I'm asking $340, shipped to anywhere in the US or Canada. I will accept PayPal, or US/Canadian Postal Money Order. I may consider a personal check if I have a good phone conversation with you. Please contact me via [my callsign]@....

You may be right about the 75 mile distance being wishful thinking. But I'm still thinking of getting a directional antenna and trying anyway. If I fail, I fail.

Thanks for the info about grounding... I'll look up that kit.

In the meantime, I'm just trying to figure out how to program the BCD396XT, so I may have to put the antenna project on hold for a while until I figure it out some more..... hard for me to concentrate on more than one thing at a time now as I get older ;)

Thanks,
Preston

I guess I should have mentioned I'm in Joplin, MO too (in the far SW corner of the state, about 7 miles East of the KS state line and about 9 miles from the NE corner of OK), and the city I'd like to pick up with a directional antenna is Springfield, which is 70-75 mi East of here.

I guess I probably should have said I'm in a "half bowl". Sorry about that. I have about a 30 ft hill to my North and about a 15 ft hill to my West (both about 100 yards away), but a clear shot to the East which is where I was wanting to point it.
Sounds like this will be "iffy" in picking up the 400mhz signals from the East though.... which is why I didn't want to invest a lot of money in a second & directional antenna that only *might* work. But since I was going to be putting the mast up now, figured this was the best time to try putting something directional up (in addition to an omnidirectional for local) so I wouldn't need to try putting it up later.

Where on the antenna would I want to attach the solid lightning wire? And if I did put up two antennas, I assume each would need to have their own independent lightning wire(?)

Ok, looking at satellite images & a terrain overlay, Joplin to Springfield looks relatively flat.

To answer a question you asked in another message, presuming a metal mast, the ground wire (SOLID WIRE) is attached to the bottom of the mast and run the shortest path to a ground rod. Yes, 8' to 10' ground rod hammered so only a few inches is above ground.

Joplin is in thunder storm alley, you get frequent & severe thunder storms, I would NOT cheap it out on grounding and then hope for the best.

I'd give you about a 60% chance of success, but I 'd suggest you drive I-44 and note the terrain, is it pretty flat, or is there a ridge line or fairly hilly section between Joplin & Springfield? That would help you gauge your chances of success.

OK well first off do you have the serial to USB adapter? You need that and the correct drivers for your adapter? If you have Windows 7 or older either the prolific or the FTDI cable will work. Prolific drivers won't work with Windows 8. If you have all that make sure you have the serial port enabled in the scanner and that it is set to the same speed as your computer. Make sure it works then start the software and make sure you have the correct settings in the software as well as the com port selected. With that the scanner. Should connect OK.

Thanks for looking up the terrain around here. I drive I-44 to Springfield fairly often and given the terrain from here to there, I think I'd probably agree with you that a 60% chance of hearing their calls sounds about right. But I'd be willing to try given those odds. However, I am on a budget and can't spend large sums of money in the *hope* of picking up Springfield. The one good thing though is that even with relatively flat terrain, Springfield is about 300 feet higher than Joplin, so with the relatively flat terrain and the transmitting antenna(s) on their end being higher, that might give me a better chance of picking them up.

So the ground wire attaches to the bottom of the metal mast and run to the ground rod? I thought it attached to the antenna and run to the ground rod. The soil is *VERY* rocky where I live. I just don't know how I'm going to get an 8-10 foot ground rod down into the earth. A large drill was suggested, but that assumes I can get a really long drill bit, and I wouldn't even know where to get something like that. It would be hard enough if it wasn't rocky, but the ground here is more rock than dirt.

I hate to admit it, but this grounding problem may kill this project and my desire for a 30-35' mast and outdoor antenna(s) and make me go with something I really don't want to go with, like an antenna in the attic or on an inside wall.

> Joplin is in thunder storm alley, you get frequent & severe thunder storms, I would NOT
> cheap it out on grounding and then hope for the best.

So in other words, go with the $30 in-line lightning suppresor rather than the cheap one? I don't know anything about lightning arrestors and whether one is actually better than another, so for all I know it's just throwing away $25. But if the $30 is worth it I'd go with it. This is assuming of course that I can figure out a way to ground an outside antenna. I was under the impression that a ground rod only needed to be about 3-4 feet into the earth.

And yes, we're in thunderstorm alley here. I've seen some nights when the sky is lit up as if there were giant disco strobe lights lighting it up. Others when it truly sounds as if bombs have gone off in the back yard. And then there are the tornadoes, but I digress...

Thanks again,
pw

I don't know if I should update the firmware in mine before I start trying to program it or just leave it alone. How can one tell what the current version is and what the current version is in one's scanner?

Funny a question about firmware would be posted right now. It's exactly what I was thinking about when this appeared in my Inbox. I'm sure glad I found this list :)

No bit needed - you put the ground rod in where the bit would go.
That's why you need the large drill and not just the standard size.
Even though the ground rod is not cut to drill, it usually works.

A sledge hammer and a ladder will help. Yes, to the mast! The ground portion of the antenna grounds via the mast. And yes, a good lightning arrestor on the coax right before it goes into your house, and the arrestor gets attached to the same ground or a 2nd ground rod if where you run the coax isn't near where you ground the mast.

For the arrestor, presuming you have copper plumbing, it can be grounded to a nearby outside water spigot. The mast can NOT be grounded to a spigot.

From the National Electrical Code Grounding and Bonding Article 250.53

(G) Rod and Pipe Electrodes. The electrode shall be installed such that at least 2.44 m (8 ft) of length is in contact with the soil. It shall be driven to a depth of not less than 2.44 m (8 ft) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or, where rock bottom is encountered at an angle up to 45 degrees, the electrode shall be permitted to be buried in a trench that is at least 750 mm (30 in.) deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in 250.10.

From the National Electrical Code Radio and Television Equipment Article 810

Article 810.15 Grounding. Masts and metal structures supporting antennas shall be grounded in accordance with 810.21.

810.20 Antenna Discharge Units — Receiving Stations.
(A) Where Required. Each conductor of a lead-in from an outdoor antenna shall be provided with a listed antenna discharge unit.
Exception: Where the lead-in conductors are enclosed in a continuous metallic shield that either is grounded with a conductor in accordance with 810.21 or is protected by an antenna discharge unit.
(B) Location. Antenna discharge units shall be located outside the building or inside the building between the point of entrance of the lead-in and the radio set or transformers and as near as practicable to the entrance of the conductors to the building. The antenna discharge unit shall not be located near combustible material or in a hazardous (classified) location as defined in Article 500.
(C) Grounding. The antenna discharge unit shall be grounded in accordance with 810.21.

810.21 Bonding Conductors and Grounding Electrode Conductors — Receiving Stations. Bonding conductors or grounding electrode conductors shall comply with 810.21(A) through (K).
(A) Material. The bonding conductor or grounding electrode conductor shall be of copper, aluminum, copper-clad steel, bronze, or similar corrosion-resistant material. Aluminum or copper-clad aluminum bonding conductors or grounding electrode conductors shall not be used where in direct contact with

masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum conductors shall not be installed within 450 mm (18 in.) of the earth.
(B) Insulation. Insulation on bonding conductors or grounding electrode conductors shall not be required.
(C) Supports. The bonding conductors and grounding electrode conductors shall be securely fastened in place and shall be permitted to be directly attached to the surface wired over without the use of insulating supports.
Exception: Where proper support cannot be provided, the size of the bonding conductors and grounding electrode conductors shall be increased proportionately.
(D) Mechanical Protection. The bonding conductors and grounding electrode conductor shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the contained conductor or to the same terminal or electrode to which the conductor is connected.
(E) Run in Straight Line. The bonding conductor or grounding electrode conductor for an antenna mast or antenna discharge unit shall be run in as straight a line as practicable.
(F) Electrode. The bonding conductor or grounding electrode conductor shall be connected as required in (F)(1) through (F)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding conductor shall be connected to the intersystem bonding termination.
Informational Note: See Article 100 for the definition of Intersystem Bonding Termination.
(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping systems, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to the building, as covered in 250.94
(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure, or
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosures of the power service
A bonding device intended to provide a termination point

for the bonding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure.A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
(3) In Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means as described in 810.21(F)(2), the grounding electrode conductor shall be connected to an electrode as described in 250.52.
(G) Inside or Outside Building. The bonding conductor or grounding electrode conductor shall be permitted to be run either inside or outside the building.
(H) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 10 AWG copper, 8 AWG aluminum, or 17 AWG copper-clad steel or bronze.
(I) Common Ground. A single bonding conductor or grounding electrode conductor shall be permitted for both protective and operating purposes.
(J) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the radio and television equipment grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.
(K) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

810.20 Antenna Discharge Units — Receiving Stations.
(A) Where Required. Each conductor of a lead-in from an outdoor antenna shall be provided with a listed antenna discharge unit.
Exception: Where the lead-in conductors are enclosed in a continuous metallic shield that either is grounded with a conductor in accordance with 810.21 or is protected by an antenna discharge unit.
(B) Location. Antenna discharge units shall be located outside the building or inside the building between the point of entrance of the lead-in and the radio set or transformers and as near as practicable to the entrance of the conductors to the building. The antenna discharge unit shall not be located near combustible material or in a hazardous (classified) location as defined in Article 500.
(C) Grounding. The antenna discharge unit shall be grounded in accordance with 810.21.

Subject: Re: [BCD396XT] Antenna Options for my BCD396XT

Thanks for looking up the terrain around here. I drive I-44 to Springfield fairly often and given the terrain from here to there, I think I'd probably agree with you that a 60% chance of hearing their calls sounds about right. But I'd be willing to try given those odds. However, I am on a budget and can't spend large sums of money in the *hope* of picking up Springfield. The one good thing though is that even with relatively flat terrain, Springfield is about 300 feet higher than Joplin, so with the relatively flat terrain and the transmitting antenna(s) on their end being higher, that might give me a better chance of picking them up.

So the ground wire attaches to the bottom of the metal mast and run to the ground rod? I thought it attached to the antenna and run to the ground rod. The soil is *VERY* rocky where I live. I just don't know how I'm going to get an 8-10 foot ground rod down into the earth. A large drill was suggested, but that assumes I can get a really long drill bit, and I wouldn't even know where to get something like that. It would be hard enough if it wasn't rocky, but the ground here is more rock than dirt.

I hate to admit it, but this grounding problem may kill this project and my desire for a 30-35' mast and outdoor antenna(s) and make me go with something I really don't want to go with, like an antenna in the attic or on an inside wall.

> Joplin is in thunder storm alley, you get frequent & severe thunder storms, I would NOT
> cheap it out on grounding and then hope for the best.

So in other words, go with the $30 in-line lightning suppresor rather than the cheap one? I don't know anything about lightning arrestors and whether one is actually better than another, so for all I know it's just throwing away $25. But if the $30 is worth it I'd go with it. This is assuming of course that I can figure out a way to ground an outside antenna. I was under the impression that a ground rod only needed to be about 3-4 feet into the earth.

And yes, we're in thunderstorm alley here. I've seen some nights when the sky is lit up as if there were giant disco strobe lights lighting it up. Others when it truly sounds as if bombs have gone off in the back yard. And then there are the tornadoes, but I digress...

Thanks again,
pw

Ok, looking at satellite images & a terrain overlay, Joplin to Springfield looks relatively flat.

To answer a question you asked in another message, presuming a metal mast, the ground wire (SOLID WIRE) is attached to the bottom of the mast and run the shortest path to a ground rod. Yes, 8' to 10' ground rod hammered so only a few inches is above ground.

Joplin is in thunder storm alley, you get frequent & severe thunder storms, I would NOT cheap it out on grounding and then hope for the best.

I'd give you about a 60% chance of success, but I 'd suggest you drive I-44 and note the terrain, is it pretty flat, or is there a ridge line or fairly hilly section between Joplin & Springfield? That would help you gauge your chances of success.

The version in mine is 1.11.01. If that's not the newest version, anyone know where I can find where the instructions are to update it?

It's driving me crazy at the moment. For some reason it started picking up local radio stations. It's the Close Call feature. I've tried turning it off in different ways I thought would work, but it's still doing it. So I've just had to keep it entirely turned off for most of the last day.

7787. Band Scope

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-06 05:22:55 UTC
From: kb6uda
Topic: 1086 Message: 7787

Hi,

I currently have the old 2006 396T.

I have been reading about something called a "band scope" the 396XT has.

Is this kind of like a spectrum analyzer that tells me what is going on over a certain part of the band.

Like can I set it to look for activity 200 KHz from a center freq and see what happens?

Or does it do something like if I activate a key lock opener for my car does it show what feq is being used by a very short low power burst transmission saying it is really close?

Best Regards
Sincerely,
Ted

7788. Close Call

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-06 05:25:37 UTC
From: kb6uda
Topic: 1024 Message: 7788

Hi,

How accurate is the close call compared to the 396 or 2006? I find that I usually get about three different frequencies?

Even though I have the PL active it almost never includes this.

Has this been improved?

Best Regards
Sincerely,
Ted

7789. Searching for New Freq

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-06 05:30:46 UTC
From: kb6uda
Topic: 7789 Message: 7789

HI,

When I search the 225 to 380 MHz band I get a lot of channels that are just interference from some other source.

Have they improved this to eliminate birdies?

The reason IM asking so many questions is I bought my scanner in 2006 I it is starting to break down. Nothing serious IM sure they cant easily fix but if IM going to send it it and this 396XT is so much better as I have heard IM inclined to get it and then send in my old 396 to be fixed.

I dont want to be stuck with my Regency MX7000 and Relm scanners even though they are very nice for a month. I have been to spoiled by the 396.

Thanks for reviewing my posts.

Best Regards
Sincerely,
Ted

7790. Double Discone antenna question (for you antenna wizards)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-06 05:31:04 UTC
From: Preston Ward
Topic: 7790 Message: 7790

I ran across this "double discone" antenna on eBay and it says that it has "2.8db gain over a conventional 'single discone'" and "provides gain and lower radiation angle than conventional discones to increase your reception power."

Can someone explain to me 1) if a double is better than a single discone, and 2) what the lower radiation angle means? I can't find any reference to a "double discone" online...

In any case, it sure is a cool looking antenna :)

Thanks!

7791. RE: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-06 12:50:21 UTC
From: Michael Hopkins
Topic: 7730 Message: 7791

Antennas:

Sounds to me like a fun experiment ☐ I don☐t think SWR or impedance is going to be an issue☐these don☐t matter much for receiving ☐ but what will matter is phasing. In other words, if the signal from both antennas gets to the radio being exactly out of phase and at the same amplitude, they will cancel and if the signal arrives at the radio in phase from both antennas, they will add and you☐ll get a stronger signal. Lots of antenna designs use phasing to produce gain and/or directivity at certain frequencies and it can be achieved by feedline lengths, antenna element placement or both.

You might find it works fine or you might find it doesn☐t work well, but likely it will be good as some frequencies and lousy on others ☐ impossible to predict without analysis of exact placements, feedline lengths, etc

Lightning suppression:

Having evaluated lightning protection devices and schemes for 30 years, I can tell you the best solution is to disconnect the feedline into the building during thunderstorms. My antennas all come down to a connector block mounted on my garage wall so that I can easily disconnect the feedline inside. The plate where the connectors come in is grounded to an 8 foot ground rod via a ¾ inch braid (available at radio shack or on-line). Be careful to make sure this ground is also connected to you house/building ground so that you don☐t have two separate grounds (during a lightning strike you can get significant voltages between two grounds). You could use #10 or bigger wire but since lightning currents will only flow on the surface of the wire, solid or stranded won☐t matter.

Good luck --- love to know how the experiment works out..

To: BCD396XT@yahoogroups.com
Subject: Re: [BCD396XT] Antenna Options for my BCD396XT

Great info... thanks a bunch! (and to everyone who replied to me)
I guess what I'm thinking now is maybe I should put up a discone for local wiseband scanning and a directional TV antenna or narrowband directional(s) for those signals that are 70-75 miles away which I believe are in 154 and 460 mhz ranges. I think log periodic antennas may be out of my price range though. Is there any reason I couldn't wire two or more antennas together

in a splitter and have the signals combine into one cable? Or would it be better to set up two scanners and use two cable runs from the mast?

And then there's the issue of lightning suppression too... like what type of wire to get for a ground wire?, where it's supposed to attach to the antenna(s)?, and if this would be sufficient for in-line protection?

Also, for a 50-60' cable run, is the thicker cable going to be all that noticeable? (I think what I'm talking about is LMR400 vs RG58 -- but don't hold me to it because don't know what I'm talking about here - LOL. It's been over 35 years since I've been into radio stuff and I'm overwhelmed with all the changes. Which brings me to the BCD396XT. Talk about being overwhelmed... I had no idea how complicated this is. Last time I was really in to scanners I was using crystals. The antenna thing I think I can figure out what to do... the Uniden on the other hand, that may be a different story. A lot of the stuff in the manual is like a different language to me...

Thanks again for all the help.

Normally I'd say one of the better discones, unless your interests are limited to a specific band. I can comment on your suggestions, as I don't know those antennas.
>
> Ideally, I'd like to be able to pick up one city 75 miles away, but I still want to go with an omnidirectional at least for now.
Unless you're on a decent hill or mountain, your goals may be in conflict. There is generally a tradeoff between gain, bandwidth (as whether it covers a single band or is wideband) and directionality. You're demanding at least 2 of those, if not all 3.

The most likely antenna to get those signals from 75 miles away is a directional antenna cut for a specific band. This focuses the signals from one direction, and utilises all of the elements to contribute to the gain.

Omnidirectional antennas have to try to form a radiation pattern that looks like a pancake, which means it focuses all of its attention on the horizon. But even then, that volume of space is larger than the directional case above, so the maximum possible gain is lower.

Finally, a lot of broadband antennas don't use all of their radiating elements on any given frequency, so these have even less ability to focus the signals. However, that is compensated for by their extremely wide bandwidth. You can get directional wideband antennas (e.g. a log periodic), but their gain is a lot less than a Yagi or other narrowband antenna cut for a specific frequency in the range covered.

It may be that you either have to install 2 antennas and switch between them, or run 2 scanners (maybe one of them can be a cheap scanner).

Or move to a mountain midway between your target areas! ;)

Try this for putting in a ground rod....

Turn a garden hose on to just a trickle.
Push the ground rod into the dirt, by hand, a few inches.
Set the end of the garden hose so it's putting water at the base of the ground rod.
Now start raising and pushing the ground rod, slowly.
You will find that with each push, it is going a little further into the ground.
Just keep doing that until it's as deep as you want it.
No hammers and ladders required.
The water acts as a lubricant and also gets forced ahead of the tip of the ground rod, loosening the earth and "drilling" your hole as you go.

I'd heard this years ago and thought "no way is that going to work", probably the same thing you're thinking right now. I put in 3 ten foot ground rods in 15 minutes using this method and ended up laughing my a$$ off. No way could it be that easy.....but it is!

Probably won't work in granite but we have hard clay soil over the top of big round river rock, impossible to dig with a shovel. The water method worked really well.

If you use the hammer method, make sure you put the ground wire connection on the rod BEFORE you drive it into the ground, as the hammer will usually flatten the top of the rod to the point you can't get the connection on after you've driven it into the ground.

Interesting advice about the water. I'll have to try that.

How far apart are the frequencies?

And is this on the same transmitter or on different ones?

Mine usually only hits on one, and it's usually very close.

Do you receive these if you remove the antenna? If not, they are not
birdies and there is nothing that could do to the scanner to prevent
reception of them, as they are actual signals coming from something else
around you (likely a computer or a router).

Joe M.

From: MCH
Topic: 7790 Message: 7797

Double would be better only from the standpoint that generally speaking the more capture area you have on your antenna the more you will receive. IOW, the larger the antenna, the better.

The lower radiation angle means that transmission (and reception) will be focused on the horizon rather than in the air. You get gain on an antenna by focusing it on the horizon in order to make it more sensitive to distant signals.

Of course, if aircraft or satellite reception is your target, this would not be a good thing, but for general public safety/business/ham reception, it would be better.

If you can't disconnect the antennas, Polyphaser makes some awesome lightning protection devices. I've used them at many installations that have to remain on the air 24/7/365.

Many years ago (pre-polyphaser) I had an installation on the air about 1 week before lightning did about $2000 worth of damage. At the same installation, post-Polyphaser, I haven't had more than about $20 in damage ever since that strike. (And the lightning hit counter has recorded several hundred strikes.)

The version in mine is 1.11.01. If that's not the newest version, anyone know where I can find where the instructions are to update it?

It's driving me crazy at the moment. For some reason it started picking up local radio stations. It's the Close Call feature. I've tried turning it off in different ways I thought would work, but it's still doing it. So I've just had to keep it entirely turned off for most of the last day.

Drill down the menu choosing the last item in each list and it will show
the firmware version in the scanner. I would update it unless you have
the latest.

Close call works beautifully and I have found it to be spot on.

Yes, you can look at a slice of the spectrum, and the radio can note the RF peaks and hold them in
the display. You can then use the scroll function to tune the radio to what you have discovered. I find
it handy for tracking cable interference, and splinter frequencies. Haven't tried the car alarm transmitter/door opener. Intriguing...

You can read more about it here:

http://marksscanners.com/396XT/396xt.shtml#bandscope mode

Thank you to the group for your feedback regarding the Butel 396XT software. As I said it locks up when I try to download from the scanner to the program. However, the serial adapter will not work for me as I have the USB cable. I don't know what other driver I can use but I guess I'll have to keep looking. I own a computer repair shop and I just reinstalled Win7 so it's not that.

Thanks again,

Sean Fitz

From: Michael Hopkins
Topic: 7790 Message: 7805

I□ve seen these before --- theoretically, two antennas end-to-end and separated by at least ½ wavelength will provide 3dB of gain over a single antenna; however, the double discone shown has them end to end with no separation so I think the 2.8dB is a bit of a stretch. In some circles, 3dB is considered to be 1 S-unit (not universally accepted) for receiving; for a transmitted signal, it□s the equivalent of twice the power on a single antenna .

Lower radiation pattern simply means (if it were transmitting) the more of the radiated signal would be concentrated towards the horizon and less □up□. For receiving it will provide some gain as a result of the lower radiation angle, which is probably why they can claim 2.8dB of gain from the antenna .

Bottom line: it will probably work better, but how much is the question .

Subject: [BCD396XT] Double Discone antenna question (for you antenna wizards)

I ran across this "double discone" antenna on eBay and it says that it has "2.8db gain over a conventional 'single discone'" and "provides gain and lower radiation angle than conventional discones to increase your reception power."

Can someone explain to me 1) if a double is better than a single discone, and 2) what the lower radiation angle means? I can't find any reference to a "double discone" online...

In any case, it sure is a cool looking antenna :)

Thanks!

Subject: Re: [BCD396XT] Antenna Options for my BCD396XT

Try this for putting in a ground rod....

Turn a garden hose on to just a trickle.
Push the ground rod into the dirt, by hand, a few inches.
Set the end of the garden hose so it's putting water at the base of the ground rod.
Now start raising and pushing the ground rod, slowly.
You will find that with each push, it is going a little further into the ground.
Just keep doing that until it's as deep as you want it.
No hammers and ladders required.
The water acts as a lubricant and also gets forced ahead of the tip of the ground rod, loosening the earth and "drilling" your hole as you go.

I'd heard this years ago and thought "no way is that going to work", probably the same thing you're thinking right now. I put in 3 ten foot ground rods in 15 minutes using this method and ended up laughing my a$$ off. No way could it be that easy......but it is!

Probably won't work in granite but we have hard clay soil over the top of big round river rock, impossible to dig with a shovel. The water method worked really well.

Don,

I'm not exactly sure what you mean by "Yes to the mast!" (sounds important though) . You also said "The ground portion of the antenna grounds via the mast." Doesn't the mast ground to where it's in the ground, and the antenna grounds to the grounding rod via a grounding line/cable? That's my understanding anyway. I'm just wondering if antenna have a dedicated place to attach the ground line that runs to the ground. I can ground the lightning suppressor to the water grounding rod...

Also, can anyone recommend a good lightning suppressor?

I'm pasting in the beginning of this conversation below, just for reference:

A sledge hammer and a ladder will help. Yes, to the mast! The ground portion of the antenna grounds via the mast. And yes, a good lightning arrestor on the coax right before it goes into your house, and the arrestor gets attached to the same ground or a 2nd ground rod if where you run the coax isn't near where you ground the mast.

For the arrestor, presuming you have copper plumbing, it can be grounded to a nearby outside water spigot. The mast can NOT be grounded to a spigot.

Thanks for looking up the terrain around here. I drive I-44 to Springfield fairly often and given the terrain from here to there, I think I'd probably agree with you that a 60% chance of hearing their calls sounds about right. But I'd be willing to try given those odds. However, I am on a budget and can't spend large sums of money in the *hope* of picking up Springfield. The one good thing though is that even with relatively flat terrain, Springfield is about 300 feet higher than Joplin, so with the relatively flat terrain and the transmitting antenna(s) on their end being higher, that might give me a better chance of picking them up.

So the ground wire attaches to the bottom of the metal mast and run to the ground rod? I thought it attached to the antenna and run to the ground rod. The soil is *VERY* rocky where I live. I just don't know how I'm going to get an 8-10 foot ground rod down into the earth. A large drill was suggested, but that assumes I can get a really long drill bit, and I wouldn't even know where to get something like that. It would be hard enough if it wasn't

rocky, but the ground here is more rock than dirt.

I hate to admit it, but this grounding problem may kill this project and my desire for a 30-35' mast and outdoor antenna(s) and make me go with something I really don't want to go with, like an antenna in the attic or on an inside wall.

> Joplin is in thunder storm alley, you get frequent & severe thunder storms, I would NOT
> cheap it out on grounding and then hope for the best.

So in other words, go with the $30 in-line lightning suppresor rather than the cheap one? I don't know anything about lightning arrestors and whether one is actually better than another, so for all I know it's just throwing away $25. But if the $30 is worth it I'd go with it. This is assuming of course that I can figure out a way to ground an outside antenna. I was under the impression that a ground rod only needed to be about 3-4 feet into the earth.

And yes, we're in thunderstorm alley here. I've seen some nights when the sky is lit up as if there were giant disco strobe lights lighting it up. Others when it truly sounds as if bombs have gone off in the back yard. And then there are the tornadoes, but I digress...

Thanks again,
pw

Ok, looking at satellite images & a terrain overlay, Joplin to Springfield looks relatively flat.

To answer a question you asked in another message, presuming a metal mast, the ground wire (SOLID WIRE) is attached to the bottom of the mast and run the shortest path to a ground rod. Yes, 8' to 10' ground rod hammered so only a few inches is above ground.

Joplin is in thunder storm alley, you get frequent & severe thunder storms, I would NOT cheap it out on grounding and then hope for the best.

I'd give you about a 60% chance of success, but I 'd suggest you drive I-44 and note the terrain, is it pretty flat, or is there a ridge line or fairly hilly section between Joplin & Springfield? That would help you gauge your chances of success.

Michael,

That's good to know about separate gounds. I had no idea about that...

Sounds like the better thing to do would be to get two separate cables, one for each antenna to alleviate the possibility of the signals cancelling each other out from phasing issues.

But here's the problem... with two antennas and all the other stuff needed for them, I'm over my budget. I also realized that Springfield's fire and police depts are on two and maybe even three different frequencies (150, 400, & 800 mhz range) - although I haven't determined this for sure yet. So that would require a discone for local signals, and THREE different directional band-specific yagis in the *hope* I could pick up Springfield. Unless I win the lottery in the next few days or have some as-yet unknown rich relative die in the next couple of days, that's just not gonna happen (although I would LOVE to put up all four AND a TV antenna AND a rotator too to see what all I could pick up). But speaking of TV antennas, I happened to run across this on eBay: http://www.ebay.com/itm/251269781947?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1438.l2649
Why couldn't I put up something like this, point it towards Springfield and use it for ALL THREE scanner bands? Check the specs on it... it would cover 150, 400, and 800mhz too, and alleviate the need for three yagis. And, I could use it for TV too for when the satellite signal goes out on the TV during storms. At least that's what I'm thinking anyway. But I'm certainly no expert in this type of stuff. I'm learning as I go...

Antennas:

Sounds to me like a fun experiment – I don’t think SWR or impedance is going to be an issue—these don’t matter much for receiving – but what will matter is phasing. In other words, if the signal from both antennas gets to the radio being exactly out of phase and at the same amplitude, they will cancel and if the signal arrives at the radio in phase from both antennas, they will add and you’ll get a stronger signal. Lots of antenna designs use phasing to produce gain and/or directivity at certain frequencies and it can be achieved by feedline lengths, antenna element placement or both.

You might find it works fine or you might find it doesn’t work well, but likely it will be good as some frequencies and lousy on others – impossible to predict without analysis of exact placements, feedline lengths, etc…

Lightning suppression:

Having evaluated lightning protection devices and schemes for 30 years, I can tell you the best solution is to disconnect the feedline into the building during thunderstorms. My antennas all come down to a connector block mounted on my garage wall so that I can easily disconnect the feedline inside. The plate where the connectors come in is grounded to an 8 foot ground rod via a ¾ inch braid (available at radio shack or on-line). Be careful to make sure this ground is also connected to you house/building ground so that you don't have two separate grounds (during a lightning strike you can get significant voltages between two grounds). You could use #10 or bigger wire but since lightning currents will only flow on the surface of the wire, solid or stranded won't matter.

Good luck --- love to know how the experiment works out..

Subject: Re: [BCD396XT] Antenna Options for my BCD396XT

Great info... thanks a bunch! (and to everyone who replied to me)
I guess what I'm thinking now is maybe I should put up a discone for local wiseband scanning and a directional TV antenna or narrowband directional(s) for those signals that are 70-75 miles away which I believe are in 154 and 460 mhz ranges. I think log periodic antennas may be out of my price range though. Is there any reason I couldn't wire two or more antennas together in a splitter and have the signals combine into one cable? Or would it be better to set up two scanners and use two cable runs from the mast?

And then there's the issue of lightning suppression too... like what type of wire to get for a ground wire?, where it's supposed to attach to the antenna(s)?, and if this would be sufficient for in-line protection?

Also, for a 50-60' cable run, is the thicker cable going to be all that noticeable? (I think what I'm talking about is LMR400 vs RG58 -- but don't hold me to it because don't know what I'm talking about here - LOL. It's been over 35 years since I've been into radio stuff and I'm overwhelmed with all the changes. Which brings me to the BCD396XT. Talk about being overwhelmed... I had no idea how complicated this is. Last time I was really in to scanners I was using crystals. The antenna thing I think I can figure out what to do... the Uniden on the other hand, that may be a different story. A lot of the stuff in the manual is like a different language to me...

Thanks again for all the help.

Normally I'd say one of the better discones, unless your interests are limited to a specific band. I can comment on your suggestions, as I don't know those antennas.
>
> Ideally, I'd like to be able to pick up one city 75 miles away, but I still want to go with an omnidirectional at least for now.
Unless you're on a decent hill or mountain, your goals may be in conflict. There is generally a tradeoff between gain, bandwidth (as whether it covers a single band or is wideband) and directionality. You're demanding at least 2 of those, if not all 3.

The most likely antenna to get those signals from 75 miles away is a directional antenna cut for a specific band. This focuses the signals from one direction, and utilises all of the elements to contribute to the gain.

Omnidirectional antennas have to try to form a radiation pattern that looks like a pancake, which means it focuses all of its attention on the horizon. But even then, that volume of space is larger than the directional case above, so the maximum possible gain is lower.

Finally, a lot of broadband antennas don't use all of their radiating elements on any given frequency, so these have even less ability to focus the signals. However, that is compensated for by their extremely wide bandwidth. You can get directional wideband antennas (e.g. a log periodic), but their gain is a lot less than a Yagi or other narrowband antenna cut for a specific frequency in the range covered.

It may be that you either have to install 2 antennas and switch between them, or run 2 scanners (maybe one of them can be a cheap scanner).

Or move to a mountain midway between your target areas! ;)

Well thanks a lot Joe... you just made my decidion that much harder ;)
Now I'm torn between this thing from England, a single discone with a vertical element, and a discone without the vertical element (and that's just for the local signals I want to get with an omnidirectional antenna, I'm not talking about the directional yagi issue to Springfield). It would probably be better to get a discone with the vertical element, but I also have a big oak tree very close to where I want to put my mast, and if it grows any, then I'm going to have an issue with a tree. If I had an antenna without the vertical element, it would let me put the mast that much higher and stick the single discone on top without having to worry about that extra 4-5 feet of vertical element touching the tree for now.

Double would be better only from the standpoint that generally speaking
the more capture area you have on your antenna the more you will
receive. IOW, the larger the antenna, the better.

The lower radiation angle means that transmission (and reception) will
be focused on the horizon rather than in the air. You get gain on an
antenna by focusing it on the horizon in order to make it more sensitive
to distant signals.

Of course, if aircraft or satellite reception is your target, this would
not be a good thing, but for general public safety/business/ham
reception, it would be better.

I'll make it easier then - trim the tree. :-)

But, on the other side of things, I would recommend putting the
Scantenna on the list for consideration, too. They work great.

I've never had a double discone, but I suspect they would work much
better than the regular discone since the regular one doesn't have all
that much capture area.

Ground rods are at lowe's or home depot.

Why buy three and not just a all-band antenna and combine them.

Springfield went to a Motorola 800 except the pagers and the accidental privet channels still assigned to each fire dept and that is in the 150 mhz range other than that it is businesses that run the other frequencies like the 400 mhz.

If I were making an antenna with anti-bird as the primary goal, I would likely make a collinear much like the Austin Ferrett (I think that's the name of their multi-band collinear model). Birds tend to not perch on vertical surfaces. Again, the trick is to get as much metal in the air as you can.

The "yes to the mast" was an answer to your question about grounding the mast rather than the antenna.

Yes, even a mast that's on the ground (earth) has to have a separate ground rod, unless you have buried the first 8' of the mast.

Coax cable has a center conductor & a grounded shield. A coax lightning arrestor is basically a spark gap between the center conductor & ground rod. If the non-grounded portion of the antenna gets hit by lighting the voltage will run down the coax, and jump the spark gap and go to ground. Without the arrestor, it can go inside the home and cause lots of damage to your radio equip & home.

The majority of the lightning will arc across the antenna, into the mast and then down to the ground rod. But some WILL go down the coax, thus you need BOTH grounded properly.

Remember, lightning takes the easiest electrical path to ground which could be right thru your radio. That's why you need at least 8' of ground rod to make that the easiest electrical path to ground.

Joe,
Thanks for the input on a vertical I was thinking the same thing short of disconnecting it from mt radio and putting a charge to it and watching them fall...LOL

Hmm... very interesting about Polyphaser. I can disconnect the antenna(s) when there's lightning around, but being that I'm in Tornado Alley, we often have thunderstorms that will sneak up on us, sometimes when I'm asleep too. And those are the ones I wonder & worry about.

I just realized something though... I'm thinking about running two cables from an omnidirectional and a directional antenna, but I only have one scanner that picks up both the local AND Springfield signals (the BCD396XT), which are in the 400 and 800mhz range. Although I could attach one cable to my Pro-96 or Pro-97, they're not going to pick up the local city PD or Springfield PD or FD. So my only option would be to combine both antennas into one line and plug it into my BCD396XT. But doing that might cancel out the signals due to phasing issues(?). So now I'm confused and don't know what to do...
Decisions decisions...
Now I'm thinking what I may do it get an omnidirectional discone for the local city signals and a yagi to try to pick up the PD and FD from Springfield. Or the other (maybe even better) option would be to get a discone and a TV antenna like what I just posted a while ago and use that as a directional wideband antenna to Springfield...

-pw

P.S: I'm going through my message chronologically and am doing my best to catch up, so apologies to everyone if I say something that's out of phase in the flow of the conversation. Also, I have some memory issues stemming from health probs, so I sincerely apologize in advance to everyone if I forget about something that's already been covered or said before. If you catch me doing this, just remind me rather than think I'm not paying attention.

If you can't disconnect the antennas, Polyphaser makes some awesome
lightning protection devices. I've used them at many installations that
have to remain on the air 24/7/365.

Many years ago (pre-polyphaser) I had an installation on the air about 1
week before lightning did about $2000 worth of damage. At the same
installation, post-Polyphaser, I haven't had more than about $20 in
damage ever since that strike. (And the lightning hit counter has
recorded several hundred strikes.)

7823. Re: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-06 22:38:27 UTC
From: MCH
Topic: 7730 Message: 7823

The nulling would occur no matter where you combine the antennas - be it at the base of them or at the end of the feedline. What are the types of signals the 396 picks up that the 96 does not?

Joe M.

Preston Ward wrote:
> Hmm... very interesting about Polyphaser. I can disconnect the antenna(s) when there's lightning around, but being that I'm in Tornado Alley, we often have thunderstorms that will sneak up on us, sometimes when I'm asleep too. And those are the ones I wonder & worry about.
>
> I just realized something though... I'm thinking about running two cables from an omnidirectional and a directional antenna, but I only have one scanner that picks up both the local AND Springfield signals (the BCD396XT), which are in the 400 and 800mhz range. Although I could attach one cable to my Pro-96 or Pro-97, they're not going to pick up the local city PD or Springfield PD or FD. So my only option would be to combine both antennas into one line and plug it into my BCD396XT. But doing that might cancel out the signals due to phasing issues(?). So now I'm confused and don't know what to do...
> Decisions decisions...
> Now I'm thinking what I may do it get an omnidirectional discone for the local city signals and a yagi to try to pick up the PD and FD from Springfield. Or the other (maybe even better) option would be to get a discone and a TV antenna like what I just posted a while ago and use that as a directional wideband antenna to Springfield...
>
> -pw
>
> P.S: I'm going through my message chronologically and am doing my best to catch up, so apologies to everyone if I say something that's out of phase in the flow of the conversation. Also, I have some memory issues stemming from health probs, so I sincerely apologize in advance to everyone if I forget about something that's already been covered or said before. If you catch me doing this, just remind me rather than think I'm not paying attention.

Wow now that sound like a good idea! I don't know how well it'll work here because of how much rock here, but that sounds like a great idea. Now if I can just find where to get a 10' grounding rod... Thanks for posting that.

Try this for putting in a ground rod....

Turn a garden hose on to just a trickle.
Push the ground rod into the dirt, by hand, a few inches.
Set the end of the garden hose so it's putting water at the base of the ground rod.
Now start raising and pushing the ground rod, slowly.
You will find that with each push, it is going a little further into the ground.
Just keep doing that until it's as deep as you want it.
No hammers and ladders required.
The water acts as a lubricant and also gets forced ahead of the tip of the ground rod, loosening the earth and "drilling" your hole as you go.

I'd heard this years ago and thought "no way is that going to work", probably the same thing you're thinking right now. I put in 3 ten foot ground rods in 15 minutes using this method and ended up laughing my a$$ off. No way could it be that easy......but it is!

Probably won't work in granite but we have hard clay soil over the top of big round river rock, impossible to dig with a shovel. The water method worked really well.

That's what I was wondering... the pro 96 is a good radio and it picks up spd and greene county.. Fire sheriff and ems. I havent tried to program Maswin in to it since it needs a volume switch and I haven't been able to bring myself to pay their prices for one!
The 400 freqs are old and they do not use them anymore they are operating on the city utilities frequencies with their own talkgroups.

You could use a 3ft. copper rod with rock salt mixed into the soil for increased conductivity as your go to ground point.
Real lightning arrestors run around $3000. Ouch!

It's all fun till someone looses a front end (RF that is...)

UUUUUUUUUUUUUUUUH what did you say $3000 for a lightning arrestor? Where
are you at? I have found some for less than a $100 and some up to $500..

Topic: 7730 Message: 7828

My suggestion:
- get a directional antenna for 150 MHz (or a dual-band 150/450 yagi or tri-band yagi),
- aim it at Springfield,
- install it without lightning protection since it won't be up for very long anyway,
- convince yourself that you are not going to reliably hear anything useful from that far away (certainly not on 800 MHz);
- then sell the directional antenna,
- buy a Scantenna, discone, double discone or whatever you decide on for local listening,
- install it properly WITH lightning protection,
- and live happily ever after.

The 75 mile distance isn't going to work well enough to justify all the money you put into it, and the losses through all the add-on gadgetry to try to feed multiple antennas into the radio is not going to help.

Bill E.

Well now we're getting into family political issues when it comes to trimming the tree, which really aren't on-topic for this list :)

In the meantime, I'll check out the Scantenna too...

I'll make it easier then - trim the tree. :-)

But, on the other side of things, I would recommend putting the
Scantenna on the list for consideration, too. They work great.

I've never had a double discone, but I suspect they would work much
better than the regular discone since the regular one doesn't have all
that much capture area.

Preston Ward wrote:
> Well thanks a lot Joe... you just made my decidion that much harder ;)
> Now I'm torn between this thing from England, a single discone with a vertical element, and a discone without the vertical element (and that's just for the local signals I want to get with an omnidirectional antenna, I'm not talking about the directional yagi issue to Springfield). It would probably be better to get a discone with the vertical element, but I also have a big oak tree very close to where I want to put my mast, and if it grows any, then I'm going to have an issue with a tree. If I had an antenna without the vertical element, it would let me put the mast that much higher and stick the single discone on top without having to worry about that extra 4-5 feet of vertical element touching the tree for now.

I'd like to mention if you do pound these copper coated steel ground rods in with a sledge hameer, be certain to wear eye protection. I know of one ham who lost an eye to the shrapnel that came off a ground rod.

For that matter, he could find an old laptop with Windows XP on. Load freescan, and then plug in a 396XT, and host it at a buddy's house who in Springfield. Then he can listen over the internet...

On May 6, 2013, at 4:56 PM, William Edwards wrote:

> My suggestion:
> - get a directional antenna for 150 MHz (or a dual-band 150/450 yagi or tri-band yagi),

>> Hmm... very interesting about Polyphaser. I can disconnect the antenna(s) when there's lightning around, but being that I'm in Tornado Alley, we often have thunderstorms that will sneak up on us, sometimes when I'm asleep too. And those are the ones I wonder & worry about.
>>
>> I just realized something though... I'm thinking about running two cables from an omnidirectional and a directional antenna, but I only have one scanner that picks up both the local AND Springfield signals (the BCD396XT), which are in the 400 and 800mhz range. Although I could attach one cable to my Pro-96 or Pro-97, they're not going to pick up the local city PD or Springfield PD or FD. So my only option would be to combine both antennas into one line and plug it into my BCD396XT. But doing that might cancel out the signals due to phasing issues(?). So now I'm confused

Radioreference already has a streaming for the springfield area.
I guess since I lived near Denver (Mile High) I thought everything else from there was down hill, for the most part and when you're driving it feels like you are going down hill from there so what I am saying is I didn't relalize it was lower. sorry. I know it is toofar for me to reach with my 40' outdoor antenna.

Are you searching for military freq's? or the old 1.25 meter ham freq's?

7841. Re: [BCD396XT] Double Discone antenna question (for you antenna wizards)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-07 04:10:49 UTC
From: John Stark
Topic: 7790 Message: 7841

Never heared it called a double discone but I use a discone that has a center element and it works great. I hear every county in the state on VHF as well as other states. Even my HP1 picks up Ft Wayne 90 miles away and Louisville Ky more than 100 miles away. Great antenna but I don't use the Radio Shack version but one that's around $150. This thing survived a tornado while the scantenna didn't survive 50mph winds even strengthened.

Sent from my Verizon Wireless 4G LTE DROID

Preston Ward <ppreston69@...> wrote:

>Well thanks a lot Joe... you just made my decidion that much harder ;)
>Now I'm torn between this thing from England, a single discone with a vertical element, and a discone without the vertical element (and that's just for the local signals I want to get with an omnidirectional antenna, I'm not talking about the directional yagi issue to Springfield). It would probably be better to get a discone with the vertical element, but I also have a big oak tree very close to where I want to put my mast, and if it grows any, then I'm going to have an issue with a tree. If I had an antenna without the vertical element, it would let me put the mast that much higher and stick the single discone on top without having to worry about that extra 4-5 feet of vertical element touching the tree for now.

7844. RE: [BCD396XT] Double Discone antenna question (for you antenna wizards)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-07 12:41:58 UTC
From: Michael Hopkins
Topic: 7790 Message: 7844

Just a note about lightning and antennas:

Nothing's going to protect you against a direct lightning strike unless you do a professional installation, which most of us can't afford to do. This generally involves ground mats, multiple grounds, "seeded" ground for conductivity, feedlines bonded to the tower at the top, bottom and several places along the way, and more. Even then, direct strikes can cause blown power supplies and other problems due to ground potential rise when the lightning current travels in the ground. A friend of mine in Pennsylvania put up a 100 foot tower and did everything right. Within a year, he took a direct strike to the tower which took out light bulbs, telephones and power supplies, but the radios themselves (2 meter repeaters) were fine.

Coaxial protectors work well to take care of any induced lightning, which can be substantial voltage, but won't help in the case of a 10 to 50 thousand amp injection of current from direct lightning. For induced voltages, the old rule of thumb for telephone linemen was 1kV/meter/mile, which means 1,000 volts induced into a meter of wire a mile from a flash. If you have a wire antenna of say, 30 feet or so connected to a coaxial feed line coming into a bulkhead connector, you can see almost continuous arcing between the center conductor an shield during a thunderstorm if no protector is used. A coaxial protector will do the arcing for you.

An important point about coaxial protectors is that they are typically air gaps which fire at or above 1,000 volts (the firing voltage depends on how fast the induced voltage is rising). When they operate, your radio will see that 1kV or greater spike before the protector operates. Most radios won't like it. There are solid state protectors available which can be expensive but will operate reliably at lower voltages.

Best bet is to make sure the lightning (or it's remnants) can't get to the radio which is why I have disconnects where the feedlines come into my house. You really don't want the kinds of voltages or currents that lightning can produce inside your house.

My 2¢ --------

Power lines don't run at RF frequencies. You likely know this, but the power lines don't affect birds since they only sit on one line. If they were to sit with one leg on one line and the other leg on the other, they would be toast. But back to the topic, they would definitely feel the heat from RF burns.

There are even cases where enough power at high enough frequencies (such as radar or Pave Paws) would cook them when they flew near the site.

Of course, Mark didn't say what kind of charge he would use. I assumed RF, but maybe he meant something else.

The double discone looks like a discone placed upside down on
top of another one. The discone with a radiator is different.

Joe M.

John Stark wrote:
> Never heared it called a double discone but I use a discone that has a center element and it works great. I hear every county in the state on VHF as well as other states. Even my HP1 picks up Ft Wayne 90 miles away and Louisville Ky more than 100 miles away. Great antenna but I don't use the Radio Shack version but one that's around $150. This thing survived a tornado while the scantenna didn't survive 50mph winds even strengthened.

It sounds like that strike came in the power lines. When it comes to lightning you have to protect *everything* that enters the building - including phone lines and power lines. Did your friend do that?

Another good point to make is that if you are installing lightning protection, the best way to keep lightning out of your equipment is to not let it in the building. In other words, don't install lightning protection inside - do it at the entrance to the building.

For you hams, this *includes* rotor cables. If it enters the building, it needs protection. Otherwise, it's like installing an alarm system but leaving the window open. Lightning will find any path available.

Joe M.

Telephone lines coming into any house or building come in through a box containing lightning arrestors that are attached to a ground wire. These are typically carbon block (old style) or gas filled arrestors (modern) and they have a good history or protecting the telephone system (and houses) from lightning coming down the telephone lines. There are also multiple lightning protectors in the distribution system along the way.

Power lines are usually not a problem unless the strike is direct to the house entrance or very close. Many distribution poles have a grounded wire above the conductors plus arrestors placed periodically along the way so most lighting that hits the power lines is shunted to ground before getting into a residence. According to IEEE standards (C62-41, 45, and others) argue that primary arrestors that are now mandatory for new construction in many states, will handle any lightning remnant coming from the pole.

I agree with using protectors outside – that is the case with telephone line protectors, but for the power mains the protection is typically in the main distribution box inside. I also agree that rotor cables should also be disconnected.

Good comments….

It could be described as several vertical dipoles. Well, not exactly vertical - about 30-45 degrees off vertical. It could also be described as several "sideways vees" (think inverted vee antenna but on its side).

Another thing I need to be concerned about is ice. With the climate changing, in the 7 years I've lived here, I've noticed more and more ice/sleet rather than snow, so being that I'm still undecided as to which antenna(s) to get, maybe I should lean towards an ST4, WBD-40, or WBV-60. All these have more vertical or angled elements that would make ice less able to stick to it. I'm afraid the ST2 would be too much of a wind-catcher during thunderstorms though.

If I were making an antenna with anti-bird as the primary goal, I would
likely make a collinear much like the Austin Ferrett (I think that's the
name of their multi-band collinear model). Birds tend to not perch on
vertical surfaces. Again, the trick is to get as much metal in the air
as you can.

Mark,

I'm kinda behind and it'll take me a while to catch up to all the messages in the group, but I don't remember you mentioning MOSWIN before (could just be my memory issues too). I looked it up and got an overview of it, but wasn't able to determine in the skimming I did if it would do anything to prevent us from listening to radio traffic or not.

Could you recommend an all-band directional antenna? Or, if all of Springfield is on 800mhz, then I guess I could just get an 800mhz yagi and combine them. But then I may have that phasing issue too with a combined cable, which I guess will be, well, a guess as to whether it would happen or not. I got the feling that you think my being able to pick up Spfd from here may be just not be possible though..... right?

Don,

So basically, if I don't have the mast sunk 8' into the ground (I was thinking about 2-3 feet with it bolted to the top of the roof at 18' up), then I need three things grounded: the mast, the antenna, and the coax. ...right?

I'm kinda overwhelmed with info right now, so forgive me if I don't remember something you or someone else already told me, but I think I remember reading or someone saying that they can't all use the same grounding rod(?) Is that right or did I just imagine that? LOL

Thanks,
Preston

The "yes to the mast" was an answer to your question about grounding the mast rather than the antenna.

Yes, even a mast that's on the ground (earth) has to have a separate ground rod, unless you have buried the first 8' of the mast.

Coax cable has a center conductor & a grounded shield. A coax lightning arrestor is basically a spark gap between the center conductor & ground rod. If the non-grounded portion of the antenna gets hit by lighting the voltage will run down the coax, and jump the spark gap and go to ground. Without the arrestor, it can go inside the home and cause lots of damage to your radio equip & home.

The majority of the lightning will arc across the antenna, into the mast and then down to the ground rod. But some WILL go down the coax, thus you need BOTH grounded properly.

Remember, lightning takes the easiest electrical path to ground which could be right thru your radio. That's why you need at least 8' of ground rod to make that the easiest electrical path to ground.

I'm in PA, and while I haven't had any wind or ice issues with the Scantenna 2, that does not mean you won't. In fact, the only thing I've had issues with are antennas that are over 25 years old (they literally fell apart) and a discone losing radials in the wind (that was the cheap version).

The discones would have just as much if not more surface area compared to the ST2, so wind and ice would be just as bad or worse.

The WBV-60 looks like a good choice. I haven't heard any reports about performance of them, though.

Another possibility is a VHF (2M) Ringo Ranger. While it's made for VHF, it's got great performance on VHF, UHF, 800, and even Low Band. Note this is not the Ringo or the Ringo Ranger II - those are different models. This one is a VHF exposed collinear with a ring at the base. It would also have a pretty small cross section for wind and ice.

> Another thing I need to be concerned about is ice. With the climate changing, in the 7 years I've lived here, I've noticed more and more ice/sleet rather than snow, so being that I'm still undecided as to which antenna(s) to get, maybe I should lean towards an ST4,
> WBD-40, or WBV-60. All these have more vertical or angled elements that would make ice less able to stick to it. I'm afraid the ST2 would be too much of a wind-catcher during thunderstorms though.

7856. Re: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-07 21:21:23 UTC
From: Preston Ward
Topic: 7730 Message: 7856

Well, I know the 396 picks up the local Joplin PD and fire, but the Pro-96 & 97 do not. I believe it's because Joplin city is on an Apco-25 system. The Pro-96 & 97s will get the local Sheriffs, highway patrol, and rural fire but not Joplin city, and that's what I'm more interested in hearing (along with Springfield if possible).

The nulling would occur no matter where you combine the antennas - be it
at the base of them or at the end of the feedline. What are the types of
signals the 396 picks up that the 96 does not?

Joe M.

Preston Ward wrote:
> Hmm... very interesting about Polyphaser. I can disconnect the antenna(s) when there's lightning around, but being that I'm in Tornado Alley, we often have thunderstorms that will sneak up on us, sometimes when I'm asleep too. And those are the ones I wonder & worry about.
>
> I just realized something though... I'm thinking about running two cables from an omnidirectional and a directional antenna, but I only have one scanner that picks up both the local AND Springfield signals (the BCD396XT), which are in the 400 and 800mhz range. Although I could attach one cable to my Pro-96 or Pro-97, they're not going to pick up the local city PD or Springfield PD or FD. So my only option would be to combine both antennas into one line and plug it into my BCD396XT. But doing that might cancel out the signals due to phasing issues(?). So now I'm confused and don't know what to do...
> Decisions decisions...
> Now I'm thinking what I may do it get an omnidirectional discone for the local city signals and a yagi to try to pick up the PD and FD from Springfield. Or the other (maybe even better) option would be to get a discone and a TV antenna like what I just posted a while ago and use that as a directional wideband antenna to Springfield...

If Joplin is using P25, the PRO-96 would work just as well as the 396
with the single exception if they are on the 700 MHz band. Otherwise,
your 96 should pick them up. Your 97 will not.

7858. Re: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-07 21:27:39 UTC
From: Preston Ward
Topic: 7754 Message: 7858

The Pro-96 will pick up Springfield and Greene County??? Are you sure? Wow I didn't know that.
Because the Pro 96 & 97 don't pick up Joplin city, I never really got into them much and what they'll pick up. When I got it, I just had RS program it and they put in all the local stuff and I just left it at that.

It would be great if the 96 got Springfield. Then I could get two antennas and use one scanner for Springfield and that would solve my issue with having to combine two antennas into one cable going into the 396.

That's what I was wondering... the pro 96 is a good radio and it picks up
spd and greene county.. Fire sheriff and ems. I havent tried to program
Maswin in to it since it needs a volume switch and I haven't been able to
bring myself to pay their prices for one!
The 400 freqs are old and they do not use them anymore they are operating
on the city utilities frequencies with their own talkgroups.

7859. Beaten Subject to death

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-07 21:31:50 UTC
From: RJH
Topic: 7859 Message: 7859

Hi all,

We've kind of beaten the Antenna subject to death any chance we could move on? I don't know why this draws so much interest. We all have antennas already or we wouldn't be listening.

Thanks,

Ray

My suggestion:
- get a directional antenna for 150 MHz (or a dual-band 150/450 yagi or
tri-band yagi),
- aim it at Springfield,
- install it without lightning protection since it won't be up for very
long anyway,
- convince yourself that you are not going to reliably hear anything useful
from that far away (certainly not on 800 MHz);
- then sell the directional antenna,
- buy a Scantenna, discone, double discone or whatever you decide on for
local listening,
- install it properly WITH lightning protection,
- and live happily ever after.

The 75 mile distance isn't going to work well enough to justify all the
money you put into it, and the losses through all the add-on gadgetry to
try to feed multiple antennas into the radio is not going to help.

I'd like to mention if you do pound these copper coated steel ground rods in
with a sledge hameer, be certain to wear eye protection. I know of one ham
who lost an eye to the shrapnel that came off a ground rod.

If you can't get Joplin with a 40 footer then I have a feeling that I won't be able to get Springfield with a 30-35 footer, even if I have a high-gain yagi and with Spfd being higher up...

Mmmm... I hate having to give up on something I'd really like to do.... :(

Radioreference already has a streaming for the springfield area.
I guess since I lived near Denver (Mile High) I thought everything else
from there was down hill, for the most part and when you're driving it
feels like you are going down hill from there so what I am saying is I
didn't relalize it was lower. sorry. I know it is toofar for me to reach
with my 40' outdoor antenna.

Correct, the average norm for reception is generally more or less than 20 miles with a average antenna when it comes to the 800 MHz band although there are many exceptions due to atmospheric conditions AKA skip on the Vhf High and Lo.
No, not all of Spfld is 800 just the police, sheriff, transit and Utilities, fire (minus the privet talk-around channels and the page freq. 154.400) and EMS (Minus their privet channels) such as the HEAR Channel.
If you go to radioreference and look at the talk groups you will see Springfield and some out-laying cities as well that are on the system.

7864. RE: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-07 21:47:37 UTC
From: Michael Hopkins
Topic: 7730 Message: 7864

Had my discone up on the mast now for 2 winters in NH with some ice and a lot of snow, and it's still there..

Mike Hopkins K1VLB

Mhopkins735@...

Subject: Re: [BCD396XT] Antenna Options for my BCD396XT

I'm in PA, and while I haven't had any wind or ice issues with the Scantenna 2, that does not mean you won't. In fact, the only thing I've had issues with are antennas that are over 25 years old (they literally fell apart) and a discone losing radials in the wind (that was the cheap version).

The discones would have just as much if not more surface area compared to the ST2, so wind and ice would be just as bad or worse.

The WBV-60 looks like a good choice. I haven't heard any reports about performance of them, though.

Another possibility is a VHF (2M) Ringo Ranger. While it's made for VHF, it's got great performance on VHF, UHF, 800, and even Low Band. Note this is not the Ringo or the Ringo Ranger II - those are different models. This one is a VHF exposed collinear with a ring at the base. It would also have a pretty small cross section for wind and ice.

> Another thing I need to be concerned about is ice. With the climate changing, in the 7 years I've lived here, I've noticed more and more ice/sleet rather than snow, so being that I'm still undecided as to which antenna(s) to get, maybe I should lean towards an ST4,
> WBD-40, or WBV-60. All these have more vertical or angled elements that would make ice less able to stick to it. I'm afraid the ST2 would be too much of a wind-catcher during thunderstorms though.

From: Preston Ward
Topic: 7859 Message: 7865

Well Ray I have to take some responsibility for this. I am just a beginner in this hobby and don't know anything about antennas, very little about scanners, and nothing about the 396XT, so I'm sorry if this has gotten too off topic. If I have further questions I'll try to write to people privately. I have done that already a few times to cut down on the number of, say, "not-as-on-topic" posts, but I have suddenly become very interested in all this and putting up a decent antenna and really don't know what I'm doing at all so I just wanted to try to get as much info as possible. In any event, I apologize for how the subject went on too much for some othersin the group.

Hi all,

We’ve kind of beaten the Antenna subject to death any chance we could move on? I don’t know why this draws so much interest. We all have antennas already or we wouldn’t be listening.

Thanks,

Ray

No, the antenna does not take a separate ground. The mast mounting clamp grounds the portion of the antenna that needs to be grounded. So the mast ground acts as the antenna ground also.

One can NEVER learn to much, or from too many people.

Myself, I have been involved with radios/scanning etc since the late 50's! I do NOT know it all, in fact I know very little. I have learned a lot from the replies to the antenna and many other posts.

I am not an engineer. I am a mechanic. I am educated, a degree in electronics, but antenna theory is not my strong area, so I enjoy the thoughts, guidance and experience of others on here.

Some on this and other forums may be VERY new to this, do not discourage their questions.

I am also a model railroader, a hobby like this that encompasses a small part of the population. We need to help the "new guys" add them and others to the hobby so that we can keep up industries interest in developing new and better products and support for what they already have.

I completely agree with what you said, David. I am educated and have a degree too, but this is a hobby to me and not my bailiwick, thus I need to ask questions, even if they may not interest others. Aside from what you and others have posted about this, I've had others write to me privately too and encouraged me to keep asking questions. So with all due respect to Ray, I think that's what I'll keep doing. If the list owner thinks I'm beating a subject to death or getting too off-topic then I'll let him make that decision.

Never heared it called a double discone but I use a discone that has a center element and it works great. I hear every county in the state on VHF as well as other states. Even my HP1 picks up Ft Wayne 90 miles away and Louisville Ky more than 100 miles away. Great antenna but I don't use the Radio Shack version but one that's around $150. This thing survived a tornado while the scantenna didn't survive 50mph winds even strengthened.

Preston Ward <ppreston69@...> wrote:

>Well thanks a lot Joe... you just made my decidion that much harder ;)
>Now I'm torn between this thing from England, a single discone with a vertical element, and a discone without the vertical element (and that's just for the local signals I want to get with an omnidirectional antenna, I'm not talking about the directional yagi issue to Springfield). It would probably be better to get a discone with the vertical element, but I also have a big oak tree very close to where I want to put my mast, and if it grows any, then I'm going to have an issue with a tree. If I had an antenna without the vertical element, it would let me put the mast that much higher and stick the single discone on top without having to worry about that extra 4-5 feet of vertical element touching the tree for now.

Joe,

APCO-25 signals, for one... (I think)... which is what the city of Joplin runs, and the 400 & 800 mhz range too I believe. But I wouldn't swear to it. I really don't know much about them either. That's why I'm here... to try to find out more about the 396XT. Because it's the only thing that will get Joplin. At least AFAIK anyway.
Each time I got a scanner (Pro-34, 96 & 97) I was told they would pick up Joplin city. Now I finally have one that'll pick it up. Each time I got one I took it to RS and they programmed it with all the local frequencies but they'd never work for me in picking up the local Joplin calls, just the local county sheriffs, highway patrol, and rural fire depts. And when they wouldn't work for what I wanted I just lost interest in them.

The nulling would occur no matter where you combine the antennas - be it
at the base of them or at the end of the feedline. What are the types of
signals the 396 picks up that the 96 does not?

Joe M.

Preston Ward wrote:
> Hmm... very interesting about Polyphaser. I can disconnect the antenna(s) when there's lightning around, but being that I'm in Tornado Alley, we often have thunderstorms that will sneak up on us, sometimes when I'm asleep too. And those are the ones I wonder & worry about.
>
> I just realized something though... I'm thinking about running two cables from an omnidirectional and a directional antenna, but I only have one scanner that picks up both the local AND Springfield signals (the BCD396XT), which are in the 400 and 800mhz range. Although I could attach one cable to my Pro-96 or Pro-97, they're not going to pick up the local city PD or Springfield PD or FD. So my only option would be to combine both antennas into one line and plug it into my BCD396XT. But doing that might cancel out the signals due to phasing issues(?). So now I'm confused and don't know what to do...
> Decisions decisions...
> Now I'm thinking what I may do it get an omnidirectional discone for the local city signals and a yagi to try to pick up the PD and FD from Springfield. Or the other (maybe even better) option would be to get a discone and a TV antenna like what I just posted a while ago and use that as a directional wideband antenna to Springfield...

There are several Yahoo Groups on the subject of "Antennas", you might have
better luck asking your questions on them.

Clark

At 12:35 PM 5/8/2013, you wrote:

From: John Stark
Topic: 7790 Message: 7877

Not sure who made it but its the heavier duty discone that's around $149. Available through several places like Universal Radio and R&L and I think Groves also carries it.

Sent from my Verizon Wireless 4G LTE DROID

>Never heared it called a double discone but I use a discone that has a center element and it works great. I hear every county in the state on VHF as well as other states. Even my HP1 picks up Ft Wayne 90 miles away and Louisville Ky more than 100 miles away. Great antenna but I don't use the Radio Shack version but one that's around $150. This thing survived a tornado while the scantenna didn't survive 50mph winds even strengthened.

It would probably be better to get a discone with the vertical element, but I also have a big oak tree very close to where I want to put my mast, and if it grows any, then I'm going to have an issue with a tree. If I had an antenna without the vertical element, it would let me put the mast that much higher and stick the single discone on top without having to worry about that extra 4-5 feet of vertical element touching the tree for now.

7878. Re: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-09 00:59:27 UTC
From: Mark Mitchell
Topic: 7730 Message: 7878

with all due respect, I seriously doubt it. but what do I know if you have
a couple of extra dollars to spend you could try experimenting and then
you wouldn't have to keep beating on yourself wondering if it was possible
or not...after all that is how Edison discovered electricity.
however, you want to keep in mind that when you get ready to sell the
antenna not to expect the going price as most will want a bargain after all
it is used.
Now what you could do is have the pro-96, 97, 95, 92 or what ever you have
that is capable of receiving Springfield and carry it with when you come
to town and when your at home you could stream it from radioreference.
Theory is that you get better reception from a antenna tuned to the proper
frequency but when you are scanning various bands it certainly wouldn't pay
to buy that many antennas so hence the all-band or multi-band antenna.
another thing to consider when putting up a antenna is that a mast needs to
have guy wires every ten foot.

7879. Re: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-09 01:53:21 UTC
From: John Stark
Topic: 7730 Message: 7879

I do not have a lot of $$ but I still manage to have a really good setup of scanners and antenna's. But I shop around and get the best possible price as well. One 800mhz yagi I paid $10 for at a hamfest. Another I paid $35 new. The only antenna I splurged on was the discone for $149. my setup uses LMR400 for all antennas except one and it uses hard line that a Ham gave to me. Each coax has lightning arrestors and multiple ground rods. From the time I buy an antenna to the time it goes up it could be six months before its working due to financial issues. Point being anyone can have a nice antenna farm if they plan it out and do it as they can afford to.
Oh and a tip for those cementing poles or towers in the ground. Make certain you do not put the ground rod(s) too close to the concrete as it can cause the concrete to explode! I have seen two so far that did explode and the towers came crashing down.

7880. Re: [BCD396XT] Antenna Options for my BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-09 12:05:56 UTC
From: MICHAEL BENNETT
Topic: 7730 Message: 7880

How did your discone perform across all the bands? I bought an AUSTIN Ferrett for wideband reception but that was a total waste of money.

From: Vince Caruso
Topic: 7859 Message: 7881

Yes, Preston......you are fine sharing your questions on this email list and in fact, that is what it is here for. It is what makes this email list work; people sharing ideas.

Aside from the radio, the antenna and feed cable are the most important things to monitoring radio signals. So the more you know about antennas, the better experience you will have with your radio.

Best of luck to you.

Vince

From: worksntv@...
Topic: 7882 Message: 7882

(May 6, 2013 - Lindenwold, NJ) – At 7:00 a.m. this morning the Camden County Emergency Communications Center dispatchers began broadcasting on a new 700 MHz radio system. This $35 million investment by the Freeholder Board enables our first responders to provide critical emergency services in a more effective and efficient manner than ever before. The first call on the new system was a medical emergency in Camden City which was handled flawlessly

7883. P-25 failure to decode?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-09 17:53:20 UTC
From: shane
Topic: 7883 Message: 7883

Anyone know why the 396 will not decode P-25 on a 927mhz Ham repeater?
I have a 927mhz custom search programmed. It will stop on an FM signal fine. It will also stop on the same frequency when they are talking in P25, but will not decode the P25. I have the modulation set to default/NFM. There is no digital choice for modulation in custom search mode.
Any ideas?
Thanks,
Shane

P.S. P-25 decode works fine in the Public Safety bands.

7884. RE: [BCD396XT] Beaten Subject to death

Thanks Vince, but can you see the pickle I'm in? - LOL - I have one person saying they're tired of seeing my questions about antennas on this list, one who suggested to check out an antenna list (which I took as a hint), but several others who have told me both publicly and privately to go ahead and have at it. The lists on Yahoo dedicated to antennas seem pretty dead though from what I can decipher. I do not want to cause any problems or make any enemies here or, heaven forbid, start a flame war - LOL, especially being new on this list, however I'm still quite curious and interested in this subject and have indeed learned a lot from the people on this list, so I don't know what to do.... Lately when I see a post I have just been replying to them privately so it won't go to the list. There could be silent others out there who don't want to see posts about antennas, but then again, there could be many more who want to see them. I'm of the opinion myself though that others can learn from these posts even if my own situation doesn't apply specifically to their situation at this point in time. There still may be something they can learn from it. And I've always thought that's the true spirit of the internet. I'm sorry if my questions bother anyone. Eventually though I'm gonna have to make a decision about what to get and this won't even be an issue anymore. Then you'll have to put up with my beginner questions with the 396XT. But thanks for your post :)

Do you have the CTCSS/CDCSS SEARCH option enabled? If so, the scanner
cannot decode P25 while it is searching for tones/codes.

It's possible the signal isn't P25. There is a digital voice system called D-Star that is common on amateur repeaters and you cannot decode it with a P25 scanner. I believe there is also another digital system being used on some repeaters, but I'm not sure what that is called.

Preston,

You can also get up on the forums at http://www.radioreference.com and look for a section on antennas.
This site is another great resource.

Best of skill, and party on Garth...

there is also the NXDN Digital from Kenwood (NEXEDGE)
which some systems are using ,

IIRC;
the 396 will not decode that either..

Considering your connecting your antenna to your 396 I wouldn't worry about someone complaining about the thread as it IS on topic and related directly to the 396. If someone doesn't want to see the messages they can use the delete key.

7890. Re: [BCD396XT] Beaten Subject to death

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-10 03:24:06 UTC
From: Preston Ward
Topic: 7859 Message: 7890

Well I did join a scanner antenna group and have spent a couple hours looking around readioreference, but thus far the replies I've received have not been helpful at all. On the other hand, everyone I've had contact with on this group has been more than helpful and I *really* do appreciate the advice I've been given. Had it not been for this group -- and this is just one example -- I would have ended up putting a 3-4' piece of rebar into the ground and used that as my ground, and I very well could have also put it in with the concrete base of the mast too. I mean, it seemed like it would have been a good idea since I was already going to be 2-3' down in the hole for the mast and in very rocky soil, so why not just put my ground rod in there too and save me the extra pounding? I never would have guessed though that putting it in there with the concrete could blow the concrete apart and bring the whole thing down if it ever took a direct hit by lightning*. So tonight while I was out I got myself an 8' copper grounding rod and 4' of 4ga copper wire as suggested from this group.

Now if it hadn't have been for the helpful advice from this group, I'm sure you can all see the potential results of what I could have done. And l guess I don't need to mention again that I live in Tornado Alley, and thunderstorms are an extremely frequent event here. With my antenna being 30-35' up (plus the antenna height) it probably would have just been a matter of time before I had the whole thing come crashing down. So for anyone who's a little irritated at my antenna questions, or even a lot PO'd about them, I hope you'll indulge me and forgive me for my beginner-type or what some may consider to be off-topic questions. The antenna WILL be connected to my 396... I just decided to work on the antenna issue before I tried to conquer the programming of it since that's likely to go on for some time.

But speaking of potentially off-topic messages, does anyone on this list have a copy of Scancat software they'd like to sell me so I can program my Pro96 & 97?
(btw I cleared this with the list owner before asking)

* speaking of which, my neighbor is a concrete contractor and I was talking to him about what I had learned on this group. He said as a matter of fact he had been called out to do a job a few blocks from here where the house took a direct hit and it blew out every electronic item in the house, fried the electric system, and then somehow decided it wanted to seek ground in the rebar of the pool..... which then completely blew the pool apart as well as all the surrounding concrete.

Considering your connecting your antenna to your 396 I wouldn't worry about someone complaining about the thread as it IS on topic and related directly to the 396. If someone doesn't want to see the messages they can use the delete key.

From: John Stark
Topic: 7859 Message: 7891

Yup....amazing what lightning will do! I saw an above ground pool blown apart from lightning too.
Like you I am in severe storm/tornado area just outside Indy. There have been two small F1 in my neighborhood in the past 5 years and a couple hundred severe thunderstorms as well. The only antenna damage so far was a number of poles and the scantenna and a cheap radio shack discone. My good discone survived the tornado although it was on a pole bent over 90°. Even through 60 and 70 mph winds the antennas seem to do pretty well. A couple poles are in need of replacement now but otherwise doing well. Right now there is the discone, two 800Mhz Yagi's and a grove antenna as well as a VHF high band antenna up. The discone is fed to a DLI Multicoupler (16 channel) and then goes to among other units a 396XT, 396T, 996XT, 996T a HomePatrol 1 with Extreme and 5 PCR100's. The setup works very well with all the radios and allows me to hear almost every county in the state even on 800Mhz. I also pick up Ohio MARCS fifty miles away. The tower the discone is on has 6 8' ground rods that are in very wet soil.
I play around a lot trying to see how far away I can get control channels with my PCR1500. Doing that I run the coax straight to the 1500 and the farthest I have picked a CC up is the University of Michigan and I am 5 miles east of Indy. So proper setup can yield interesting results

Preston Ward <ppreston69@...> wrote:

>Well I did join a scanner antenna group and have spent a couple hours looking around readioreference, but thus far the replies I've received have not been helpful at all. On the other hand, everyone I've had contact with on this group has been more than helpful and I *really* do appreciate the advice I've been given. Had it not been for this group -- and this is just one example -- I would have ended up putting a 3-4' piece of rebar into the ground and used that as my ground, and I very well could have also put it in with the concrete base of the mast too. I mean, it seemed like it would have been a good idea since I was already going to be 2-3' down in the hole for the mast and in very rocky soil, so why not just put my ground rod in there too and save me the extra pounding? I never would have guessed though that putting it in there with the concrete could blow the concrete apart and bring the whole thing down if it ever took a direct hit by
> lightning*. So tonight while I was out I got myself an 8' copper grounding rod and 4' of 4ga copper wire as suggested from this group.
>
>Now if it hadn't have been for the helpful advice from this group, I'm sure you can all see the potential results of what I could have done. And l guess I don't need to mention again that I live in Tornado Alley, and thunderstorms are an extremely frequent event here. With my antenna being 30-35' up (plus the antenna height) it probably would have just been a matter of time before I had the whole thing come crashing down. So for anyone who's a little irritated at my antenna questions, or even a lot PO'd about them, I hope you'll indulge me and forgive me for my beginner-type or what some may consider to be off-topic questions. The antenna WILL be connected to my 396... I just decided to work on the antenna issue before I tried to conquer the programming of it since that's likely to go

on for some time.
>
>But speaking of potentially off-topic messages, does anyone on this list have a copy of Scancat software they'd like to sell me so I can program my Pro96 & 97?
>(btw I cleared this with the list owner before asking)
>
>
>* speaking of which, my neighbor is a concrete contractor and I was talking to him about what I had learned on this group. He said as a matter of fact he had been called out to do a job a few blocks from here where the house took a direct hit and it blew out every electronic item in the house, fried the electric system, and then somehow decided it wanted to seek ground in the rebar of the pool..... which then completely blew the pool apart as well as all the surrounding concrete.

Amazing. You don't get an intermix with all those radios running thru a single coupler?

I think the NSA would find you a valuable candidate for hire...

7893. Re: [BCD396XT] Beaten Subject to death

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-10 08:13:36 UTC
From: John Stark
Topic: 7859 Message: 7893

Nope no issues from radios or the 5 computers that are either running Unitrunker or ICOM software for those six radios or programing software for the radios.
I use the radios for media purposes. I can monitor more than local paper or the area TV stations. What's funny though is when I call stations way up north or way down south of me and tell them about something in their area and they didn't hear it on their scanners but I did 90 miles away. It happens all the time that way.one station used to ignore me, not anymore after three calls of mine got them awards.... and the checks aren't bad either.....

The setup works very well with all the radios and allows me to hear almost every county in the state even on 800Mhz. I also pick up Ohio MARCS fifty miles away. The tower the discone is on has 6 8' ground rods that are in very wet soil.
>> I play around a lot trying to see how far away I can get control channels with my PCR1500. Doing that I run the coax straight to the 1500 and the farthest I have picked a CC up is the University of Michigan and I am 5 miles east of Indy. So proper setup can yield interesting results

And l guess I don't need to mention again that I live in Tornado Alley, and thunderstorms are an extremely frequent event here. With my antenna being 30-35' up (plus the antenna height) it probably would have just been a matter of time before I had the whole thing come crashing down. So for anyone who's a little irritated at my antenna questions, or even a lot PO'd about them, I hope you'll indulge me and forgive me for my beginner-type or what some may consider to be off-topic questions. The antenna WILL be connected to my 396... I just decided to work on the antenna issue before I tried to conquer the programming of it since that's likely to go on for some time.
>> >
>> >But speaking of potentially off-topic messages, does anyone on this list have a copy of Scancat software they'd like to sell me so I can program my Pro96 & 97?

The lists on Yahoo dedicated to antennas seem pretty dead though from what I can decipher. I do not want to cause any problems or make any enemies here or, heaven forbid, start a flame war - LOL, especially being new on this list, however I'm still quite curious and interested in this subject and have indeed learned a lot from the people on this list, so I don't know what to do.... Lately when I see a post I have just been replying to them privately so it won't go to the list. There could be silent others out there who don't want to see posts about antennas, but then again, there could be many more who want to see them. I'm of the
>> >> opinion myself though that others can learn from these posts even if my own situation doesn't apply specifically to their situation at this point in time. There still may be something they can learn from it. And I've always thought that's the true spirit of the internet. I'm sorry if my questions bother anyone. Eventually though I'm gonna have to make a decision about what to get and this won't even be an issue anymore. Then you'll have to put up with my beginner questions with the 396XT. But thanks for your post :)

7894. Re: [BCD396XT] Beaten Subject to death

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-10 12:04:06 UTC
From: john szalay
Topic: 7859 Message: 7894

While your at it, make sure you set the FREQ & SAME code for your local NWS alerts for Joplin, the Freq is 162.425 mhz and the SAME code is Jasper/Joplin is   029097

In the event you want the surrounding counties SAME codes
http://www.nws.noaa.gov/nwr/CntyCov/nwrMO.htm

 Unless you want to listen to ALL the weather alerts tones go off for everyone around you, that is.
during storm season, our weather radio used to go on & on , I prefer to set only our county, some people like
to get what they consider as extra time warning , by entering a county west as well. too much noise..

John in Ky
As for the height of your antenna, my mast & beams were up at 56ft for 30+ years and it took the winds from Hurricane Ike to bring it down.. (fold over mast, so go it got serviced on a resonable time basis)

Subject: Re: [BCD396XT] Beaten Subject to death

Well I did join a scanner antenna group and have spent a couple hours looking around readioreference, but thus far the replies I've received have not been helpful at all. On the other hand, everyone I've had contact with on this group has been more than helpful and I *really* do appreciate the advice I've been given. Had it not been for this group -- and this is just one example -- I would have ended up putting a 3-4' piece of rebar into the ground and used that as my ground, and I very well could have also put it in with the concrete base of the mast too. I mean, it seemed like it would have been a good idea since I was already going to be 2-3' down in the hole for the mast and in very rocky soil, so why not just put my ground rod in there too and save me the extra pounding? I never would have guessed though that putting it in there with the concrete could blow the concrete apart and bring the whole thing down if it ever took a direct hit by
lightning*. So tonight while I was out I got myself an 8' copper grounding rod and 4' of 4ga copper wire as suggested from this group.

Now if it hadn't have been for the helpful advice from this group, I'm sure you can all see the potential results of what I could have done. And l guess I don't need to mention again that I live in Tornado Alley, and thunderstorms are an extremely frequent event here. With my antenna being 30-35' up (plus the antenna height) it probably would have just been a matter of time before I had the whole thing come crashing down.

Yes, after checking I DID have the CTCSS search enabled. I turned that off and switched it to NAC decode. I will see if that works.
Thanks for the suggestion.
Shane

You can also just turn it to off meaning no tone or NAC detect, and the radio will play P-25 anyway.

7901. Bought New BCD396XT And Am Trying To Determine Two Things

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-15 14:36:06 UTC
From: zoykz
Topic: 7901 Message: 7901

I bought a new BCD396XT from a retailer notorious for refunding a customer's money and then reselling the item as new. I am trying to determine if indeed my scanner was purchased and then programmed by the owner who decided to return it without bothering to delete/erase what he programmed. And I am trying to determine where I can find the frequencies that are supposed to be stored when I use "Close Call Auto Store". I have enabled all bands. I have a couple of sets of "walkie-talkies" and used them to emit frequencies which the BCD396XT promptly detected. I navigated Menu/Program System/Close Call/Edit Group/Found Channels and could not locate where the frequencies are stored. I did find in "Edit Channel" a list of 6 frequencies: 467.6875, 462.5875, 160.5600, 467.5625, 467.6625 and 462.6000. Does anyone know what these frequencies are? Where they placed there by a previous owner? Thank you for any help that you may give. I'd call Uniden to ask them these two questions but I get the impression that they only want calls where one of their products suffers a major malfunction.

7902. Re: [BCD396XT] Bought New BCD396XT And Am Trying To Determine Two Things

Yahoo group: BCD396XT (2011 — 2014)

From: Uniden UPMan
Topic: 7901 Message: 7902

If those channels were listed when you selected "Edit Channel" after navigating Menu/Program System/Close Call/Edit Group/Found Channels, then those are the frequencies found by the Close Call autosave. "Edit Channels" would be where you would go to review/edit/add channels in a particular Channel Group.

You mentioned you tested close call with a few handheld radios. Were they FRS/GMRS radios? Those frequencies sound like they are. At least the UHF ones.

Look here: http://www.buytwowayradios.com/blog/2006/07/frs_and_gmrs_frequencies.aspx

The way to tell if your radio is different from the factory setting is to look at the list of default counties/cities the radio is programmed to out of the factory:

Look here and scroll down: http://wiki.radioreference.com/index.php/BCD396XT#Preloaded_Systems_and_their_System_Quick_Keys

I am trying to determine if indeed my scanner was purchased and then programmed by the owner who decided to return it without bothering to delete/erase what he programmed. And I am trying to determine where I can find the frequencies that are supposed to be stored when I use "Close Call Auto Store". I have enabled all bands. I have a couple of sets of "walkie-talkies" and used them to emit frequencies which the BCD396XT promptly detected. I navigated Menu/Program System/Close Call/Edit Group/Found Channels and could not locate where the frequencies are stored. I did find in "Edit Channel" a list of 6 frequencies: 467.6875, 462.5875, 160.5600, 467.5625, 467.6625 and 462.6000. Does anyone know what these frequencies are? Where they placed there by a previous owner? Thank you for any help that you may give. I'd call Uniden to ask them these two questions but I get the impression that they only want calls where one of their products suffers a major malfunction.

Finding those frequencies after you scanned "Close Call" to determine if
the scanner is new is not a true test of it being new or used.
You probably entered those frequencies yourself when using your
"walkie-talkies".

7907. Latest Firmware for UBCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-21 08:25:59 UTC
From: Mike
Topic: 7907 Message: 7907

I've just bought the Australian version and I'm wondering if the 1.02.03 firmware is the latest version.

The Uniden website only has the Updater - UBC_VUP_v1_5_2_0 Firmware.zip

It seems I wasted my time downloading and installing this, as when I ran the program, there was no Firmware file (.scn) to update !

From: Jacqueline Blanch
Topic: 7909 Message: 7909

Hi,

I just purchased my first scanner (BCD396XT).

My problem is I am unable to get my Windows 7 64 computer to recognize the scanner. I have purchased 2 different cables and even though my device manager states that they are both working correctly; I'm still not having any luck.

PL-2303 Driver installed on computer.

FreeScan is also unable to find the scanner.

Cable 1

http://www.amazon.com/gp/product/B001JT346I/ref=oh_details_o08_s00_i00?ie=UTF8&psc=1

Cable 2

http://www.amazon.com/gp/product/B0007T27H8/ref=oh_details_o04_s00_i00?ie=UTF8&psc=1

Not sure about all this "chip" talk yet.

Anyway, any help would be appreciated.

Thanks,
Jackie

Jackie..Go to Control Panel. then scroll down to Device Manager.
click on ports..If the driver is installed corrrectly, You should see an assigned comm port listed..Make sure this port matches your settings in FreeScan..

Confirm that scanner and FreeSCAN are set to the same baud (speed) rate.
On scanner go to Menu/Settings/Set Serial Port/115200 bps.
On FreeSCAN go to Scanner/Control Scanner/Com Port/Port 115200/and Com port
as displayed in Device Manager
When USB cable is connected to computer and also connected to the BCD396XT.

I assume with cable 2, that you are also using the serial cable that came
in the box with the scanner.

I think most of talk about a certain chip concerns with Windows 8. Not sure
also.

Here is the website for Uniden Australia

http://www.uniden.com.au/australia/index.asp

I will keep looking for firmware upgrade but your best bet is contacting the people at the site listed above I would think they would be the ones who could direct you to the firmware upgrades if any where released,

Hope this helps,

Bob

Topic: 3757 Message: 7917

It's not usually called an RS232 port - it's called a
NMEA port (which just happens to use the RS232 protocol).

Uniden makes a GPS that plugs right into the scanners.

Several other manufacturers make GPSs that plug in using a
null-modem-gender-changer. (such as Byonics and Delua)

If you search for GPSs made for ham APRS, those will usually work, too.

Your doing better than me if you have version 1.02.03

I bought a 396XT a few days ago, new from a store in Melbourne and it's running 1.02.02

Where can I get the 1.02.03 firmware version ?

Seems the U.S. and your version are the same?
Freq. coverage seems the same.
Try updating with the upgraded firmware updater app. from Uniden's USA site.

This might be a UPman inquiry up either here and or Radio Reference.

Thanks for the info. I see my thought process was totally wrong when I asked this question. I was thinking you could use a car GPS (ie: TomTom, Garmin) to hook into the Scanner. I see now this is a different kind of GPS concept that I am going to have to read up on.

This may be of some interest to you:

<http://forums.radioreference.com/uniden-scanners/266655-using-garmin-nuvi-uniden-scanner-gps.html>

Also, many of the handheld Garmins come with a 9 pin cable and output NMEA data the the scanner needs.

7926. Trunk systems with multiple sites

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-24 21:05:17 UTC
From: Michael Hopkins
Topic: 7926 Message: 7926

Trying to re-program some changes to the Massachusetts state police trunking system:

I have 2 systems: one is Mot Type II/P25 and the other is P25S.

In the Mot Type II/P25 system, I have 19 sites each consisting of a number of frequencies per Radio Reference.

3 of those sites are re-banded. Do I need to make a separate system for the re-banded sites? I also have 7 groups - Troop A, Troop B, etc. some of these will use the re-banded sites so do they need to be separated somehow?

The rebanded sites each have two system ranges in the band plan, one with a 440 offset and the other with a 0 offset - both are 25 kHz steps. I'm not 100% sure this is right but it appears to be.

I'm programming using FreeScan - the manual says you can only have one trunked system per band but not sure how this is assigned in FreeScan. I can assign a quick key 0-99 but how does the band get assigned? 0-9 is one band?

Any help would be appreciated.

Thanks,,,,

It's actually both. Mass State Police are currently using both a Motorola Type II system and a P25S system. I programmed both systems in separately, but my questions below pertain to the Mot Type II system:

In the Mot Type II/P25 system, I have 19 sites each consisting of a number
> of frequencies per Radio Reference. 3 of those sites are re-banded. Do I need to make a separate system for the

Topic: 7926 Message: 7930

OK. First, you should not be using a P25S system which is a P25 Single Channel Trunk system - you should be using a regular P25 selection for the trunked system. Also, for rebanding P25 systems all that is required is to change the frequencies - no tables are required at all. Also, you only need to program the control channels (Primary and Alternate).

On the Motorola system, you will have to program the new rebanded frequencies, set the system type to Custom, program in the two rebanding trunking tables (see below), and you should be good to go.

The tables you need are:
BandPlan Base (lower) Base (upper) Offset Polarity Spacing
1 851.0250 854.0000 440 + 25 khz
2 851.0125 868.9875 0 + 25 khz

The above may be more info than you need, but I gave you everything you might need - use the columns that apply to your software.

You can program each site to Custom and enter the tables as they reband. You don't need a separate System for rebanded sites.

7931. RE: [BCD396XT] Trunk systems with multiple sites

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-25 20:06:36 UTC
From: Michael Hopkins
Topic: 7926 Message: 7931

Thanks.. Now double checking all..

In FreeSCAN the P25 system types are:

P25 Standard (Digital XT)

P25 One Freq Trunk (Digital XT)

I selected P25 Standard, which I believe is correct.

In Radio Reference it's called a Project 25 system.

In FreeScan, in the listing of all systems, its listed as (P25S) as opposed to (P25F), which refers to the single frequency trunk system.

Confusing, but pretty sure the P25 Standard system is correct..

In the Mot Type II system, (In free scan called Mot Type II/P25) which I assume means it's both analog and P25 digital modulation. There is no other Mot Type II system selection.

Most sites are not rebanded so I didn't add the band plan chart to them all. I DID add the band plan info you sent to the two re-banded sites.

Will check to see if it's now working tomorrow when I head south into MA..

Thanks for the info.

You are correct. P25S is sometimes used to indicate P25 (Single-frequency). I guess it's not in FreeScan.

7933. Showing Unit ID Names automatically

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-26 13:19:05 UTC
From: Mike
Topic: 7933 Message: 7933

As a FireCom Operator, it's really useful to be able to identify the unit calling - even if their name is missing from the call due to clipping of the start; doubling transmissions; a mumbling caller . . . or me just being distracted when the call starts !

I'd seen some brief references in the Manuals suggesting that you can display Names from UnitIDs, but could never figure out how to do it. Then when I was Searching the Trunked System, I noticed an iCall displaying much like a TalkgroupID - i1234567 SRC / i2345678 DST. You need to turn on "Disp Unit ID" in Settings.

I'd noted a few of our networks' UnitIDs, so I just added them to the end of the TGID numbers and Names in the Group.

Sure enough, the next time they called in, on Row 2 (in Disp Mode 2) I could see the TGID Name alternating with the UnitName (instead of the UnitID number) I had entered.

In Disp Mode 3, the TGID Name appears in large letters on Row 2 and the UnitName appears in small letters on Row 3 (instead of the TGID Number).

What's really disappointing is that Bearcat decided to erase the name a few seconds after the transmission ends - it would be so helpful if the Name of the last received Unit stayed up until another was received.

Mike

Radio Names have to be "programmed" in order to display. If I recall correctly, you just enter them as a talkgroup with a dot at the beginning (translates to "i" in display). If you know that radio 3611 (decimal) is Med 11, just add ".3611" in the talkgroups list and then change its name.

Yes, this is a great feature, but unfortunately it is also crippled by the maximum of 500 TGIDs per system. If you add all of the NSWFB and NSWRFS TGIDs, there isn't much space left to start adding UIDs. It would be great if the next firmware update could allow UIDs to be labelled independently of the TGID limit (and better still if the TGID limit could be raised to 1000 or more).

Even s thousand wouldn't be enough
If I could add all the UID's I have for one system it would take close to 30,000 and if I added all of them it would require 65,000. And with newer systems that number could double. That's where programs like Unitrunker take over as it removes the scanners limitations on number of TGID's and UID's. I have two computers running Unitrunker 24/7 just to keep up with UID's and so on. Its also great for finding and logging new TGID's as well.

7938. Question for the 396/996 experts . . .

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-27 03:43:48 UTC
From: neilbell99
Topic: 7938 Message: 7938

I want to monitor five cities in a metro area. Each city has 2 or 3 channels and all are conventional, not trunked channels. Which option should I choose?

1. - Have all 12 channels in a single group under a single SQK, OR
2. - Have a separate group for each city, each with a GQK under a single SQK.

The advantage of separate group GQKs allows me to turn off (or on) each city but I don't want to sacrifice scan speed if it causes a significant reduction in scanning speed.

Suppose each city had a separate SQK? - would that impact scan speeds?

Informed opinions welcomed!!

Neil Bell, KJ6FBA

I would choose the separate SQKs. Any of the options should
not impact the scan speed as long as the HOLD TIME is set to 0.

Either is a good option, but were it me, I would put them a single system & use separate groups for each city.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-27 14:27:25 UTC
From: Lance
Topic: 7938 Message: 7941

If it was me, I would create a single conventional system, and then put each city into it's own group starting with Group 1.

Something like this in the labeling of it for your own recall:

1 Metro Areas
1 "name of city"
2 "name of city"
3 "name of city"
4 "name of city"
5 "name of city"

So in this example your system has a number designator, and so do your groups.
Now assign your system (Metro Areas) and groups within it, some quick keys based on the numbering
example above if that suits you.

So if you press "1" on the key pad, "Metro Areas" is scanned. Then when you hit or press "FUNC" + the City number, this will turn on or off each city.

I know this is an over explanation, but wasn't sure how new to the radio you are.

Have fun,

-Lance

7942. Software has not detected your scanner

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-27 18:18:10 UTC
From: Michael Weidemeier
Topic: 7942 Message: 7942

Can anyone solve this problem?

My ARC-XT Pro software cannot detect my scanner. I purchased the USB cord from scanmaster. I thought I installed the driver to make it work. Then I plugged in my scanner and did the RS232 communication setup. All the comport settings are red which indicates not available.Is that normal? Then something poped up on my computer that said installation of driver Pl2303was not completed. So I guess i plugged in the scanner before I installed the driver. What do I do to correct the problem? The "help" instructions say press MENU, select 'Xfer Information,''PCControl'. I pressed Menu and I can't find Xfer Information" or 'PC Control' on my scanner. The HELP on the software says to go to section 8.2 for troubleshooting. However my help software only goes to 6.2

Terribly frustrated, any help would be appreciated,

Mike

I would remove the device from the Device Manager and reinstall it. Make sure you don't plug in your scanner until you have the driver properly installed and it shows in the COM ports.

If you are running 64 Bit Windows then be sure to install the 64-Bit
version of the USB driver, you can download it from ScannerMaster.com.

I presume you installed the drivers properly after you got that error, if not, then your first step is to properly install the drivers and so a COM: port shows up.

Then, once that's done, plug your scanner serial cable into both the scanner & the USB adapter, turn on the scanner, and start the ARC software.

In the top menu of the ARC software is a dropdown for your serial setup, just run that. I'm not at my computer so can't give you the name of the menu item, but it's one of the middle items.

Your idea of using separate GQK's for each city will serve you well. As Joe said, you will not be sacrificing any scan time.

make sure there are custom bands set for filtering in Broadcast Screen:

http://marksscanners.com/396XT/396xt.shtml#broadcast screen

Also, I have you tried switching antennas?

correction! make sure their are NO customs bands set for filtering :

http://marksscanners.com/396XT/396xt.shtml#broadcast screen

What happens when you try another antenna?

Mick, assuming you are in Australia - Most if not all Police Forces have switched to Motorola P23 Digital Encrypted services - if you are in Western Australia you will find WA Police have their encrypted P25 service in the 501-503Mhz range

The southern NSW channels were still analog last time I checked, but I think they have turned off the centre point tower repeater for those channels. I can check to see if Wagga is still active on analog if you're interested.

I can't comment on 468 MHz, but at 477 MHz it's not too far behind the
UHF CB (and most of that difference would be in the antennas). I use
mine mostly around 160 MHz for CFA frequencies, and again, no dramas
there, other than the occasional intermod from police and commercial
frequencies in a couple of small areas, to be expected as I'm using a
1/2 wave for 160 MHz on the car.

7954. Accessories in the UK

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-31 00:40:39 UTC
From: blitznpieces
Topic: 7954 Message: 7954

Hi everyone

New to the group, so Hi, I am Simon living near Lytham St Annes in the UK.

I've just bought a used 396T off a friend but iunfortunately it doesn't come with any accessories.

I need the following,

Belt Clip
AC Adapter

I've tried one of those "Multi" adapters from eBay but even with the 6 different ends they supply none of them fit the Uniden. I cannot get any of the adapter plug ends to fit the radio so I am just running from batteries I re-charge in a seperate unit but would really like an adapter.

Also I have the Uniden UCB800XLT and need the mains adapter for that too. I haven't tried the multi adapter with this one, I am assuming it will not work as it won't fit the 396.

Can anyone help with where I can purchase these items from either here in the UK or from another country.

Many thanks and I look forward to having a look round the posts.

Simon

Don't rely on updated Firmware to clear up all the problems on P25 Systems.
Many Simulcast systems are giving scanner enthusiasts frustrations, both
with Uniden and GRE (also Radio shack).
Search with "Scanners and P25 Simulcast Systems" and see for yourself.

Actually, the USA has UHF CB as well. It used to be called
"Class A CB" but the name was changed decades ago to "GMRS".

Specifically FMRS is lower power and requires no license, whereas, GMRS is higher power and, in theory, requires a license.... Although the license requirement is almost never enforced, and in fact, there is a proposed rule change to eliminate the license retirement.

At the time it was Class A CB, all CB was licensed, too - including Class D CB on 27 MHz. FRS was not even a gleam in someone's eye at the time, but yes FRS came out of GMRS. So, FRS is sort of the grandchild of UHF CB. BTW, Class C CB was (is?) for remote control. Those are those 'missing' channels that happen every 4 channels in the original 23 channel bandplan. I don't think there ever was a Class B CB, but there may have been.

7964. Trunk programming problems

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-31 21:58:22 UTC
From: Michael Hopkins
Topic: 7964 Message: 7964

Trying to get MA State Police system working --- it's a Motorola Type II with some re-banded sites.

I programmed in the 24 sites per Radio Reference and created groups for Troops A, B, C, D, E, F, and H.

Scanning with ID SCAN selected, provided no signals.

Scanning with ID SEARCH provided many signals but no State Police.

Another forum suggested I try scanning just one site, so I did that --- it was a rebanded site and the results were the same as above. Checking the frequencies, I notice they were all of the NOT re-banded type, so I changed the site back to a standard Type II with again, the same results.

I stepped through the frequencies programmed and could hear the control channel (strong) and signals on all the programmed frequencies INCLUDING STATE POLICE Troops A, C and E on one frequency - 8xx.71250 (think it was 857, but not sure). Back to scan and no signals heard.

I have another Type II re-banded system in the scanner but it only has one site and several groups and it works fine.

So, I'm at a loss. Tried everything I can think of but apparently in the scan mode (ID SCAN or ID Search) it refuses to land on the active state police frequency. Am I doing something wrong? Anyone out there got a FreeScan file that works and I could steal from???????

Anybody got a clue??

Could that one frequency be part of the P25 system and not the Type II system? Is it possible you have the talkgroups programmed in but disabled somehow? (in a disabled group, in a locked-out group, in a locked-out channel, or in an ID lockout list)

What site is that frequency part of? Does that frequency come up as part of that site? Knowing the xx would help greatly in diagnostics since a result of 851 vs 854 vs 868 could make a big difference in the cause.

7966. batteries question for UPMAN and the experts

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-05-31 22:52:47 UTC
From: neilbell99
Topic: 7966 Message: 7966

I use rechargeable batteries and NEVER charge them in the radio. My question is:

If I set the switch in the battery compartment to Alkalines but still use just my regular Eneloop batteries can I run the scanner on the AC adapter while I am home at my desk? That way I could leave the backlight on without running down the Batteries when I am home?

Also would the low battery power alarm go off too early thinking I was on Alkalines bather than rechargeables?

Any risk here?

Neil, KJ6FBA

The scanner should not attempt to charge the cells when the switch is in the Alkaline position. In fact, there may be circuitry to prevent charging alkaline cells (a little OT, but good to know). So, you should be good using your Eneloops with the switch in the ALK position. I'm not sure about the low battery alarm. I *think* the switch just opens the charging circuit, but it's possible it resets the low cell alert trigger. Try it and see. If it alerts too soon, let us know so it goes in the collective knowledge bank.

7969. RE: [BCD396XT] Trunk systems with multiple sites

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-02 21:03:50 UTC
From: Michael Hopkins
Topic: 7926 Message: 7969

Problem resolved: I took someone's advice and programmed an single site know to have MA SP activity and a single group with the State Police TGID's entered - it worked fine. I then added sites, one at a time with no problem. Next I added re-banded sites, and again, no problem..

Apparently the problem was the 396xt didn't like having so many multiple sites AND multiple TGID groups. Two identical systems, on with multiple groups doesn't work, one with a single group works fine..

Hope this helps someone!

To: BCD396XT@yahoogroups.com
Subject: [BCD396XT] Trunk systems with multiple sites

Trying to re-program some changes to the Massachusetts state police trunking system:

I have 2 systems: one is Mot Type II/P25 and the other is P25S.

In the Mot Type II/P25 system, I have 19 sites each consisting of a number of frequencies per Radio Reference.

3 of those sites are re-banded. Do I need to make a separate system for the re-banded sites? I also have 7 groups - Troop A, Troop B, etc. some of these will use the re-banded sites so do they need to be separated somehow?

The rebanded sites each have two system ranges in the band plan, one with a 440 offset and the other with a 0 offset - both are 25 kHz steps. I'm not 100% sure this is right but it appears to be.

I'm programming using FreeScan - the manual says you can only have one trunked system per band but not sure how this is assigned in FreeScan. I can assign a quick key 0-99 but how does the band get assigned? 0-9 is one band?

Any help would be appreciated.

Thanks,,,,

UHF CB stands for Ultra High Frequency Citizens Band radio. Originally 40 channels, it is has become 80 channels with the latest ACMA changes to bandwidth. The truckies use channel 40, channel 5 is an emergency channel. You can buy CB radios at Dick Smith, etc. In Australia, no licence is required to transmit on these channels up to 5 watts.

I don't know what UHF CB is. Is it in U.S.? Sometime with your head down in the trenches you don't know of new things if you look up.

I can't comment on 468 MHz, but at 477 MHz it's not too far behind the UHF CB (and most of that difference would be in the antennas). I use mine mostly around 160 MHz for CFA frequencies, and again, no dramas there, other than the occasional intermod from police and commercial frequencies in a couple of small areas, to be expected as I'm using a
1/2 wave for 160 MHz on the car.

Welcome to the list.

I think the consensus among most is that each (scanner) application is likely to have unique strengths and weaknesses (for instance, some have screens or user interfaces where manual entry is easier, some have advanced features such as remote control or band scope). A good approach may be to start with the free applications (freescan, etc.) and see which of those you like best and/or if they're lacking a specific feature that you feel you need. If you can articulate what those features are, folks on the list can provide guidance, experience and advice on which application they feel might be best for that particular task.

I typically use FreeScan to program and bcTool+ for logging and recording.

I hope that helps,
Matt

As some have mentioned, FreeSCAN is free but if you use it and like it, a contribution to the author would be welcomed.
I prefer and use Butel ARC-XT Pro. The Butel programs have a 30 day trial period before a purchase is required, so you
can decide for yourself if it meets your needs.

7977. Excluding unwanted TG from NYC DOITT UHF

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-04 21:30:28 UTC
From: policepeer
Topic: 7977 Message: 7977

Hello all, I have a newbe question which I have been unable to find an answer to on the boards.

I recently purchased a Uniden 396xt and use it with Proscan. (Excellent software) On the NYC DOITT UHF trunked system, there is just one thing I want to hear, EMS Notifications (TG 5360). When I downloaded the data from RR, it downloads a bunch of agencies and SIMLUCAST. I can get rid of all the other TGs and have only the FDNY EMS Notifications and yet I hear many transmissions that are not TG 5360. For instance, SIMLMUCAST ID 6800.

I have tried to delete the simlucast channels but then cant get any TG. Is there a way to exclude the other transmissions which come up via SIMUCAST??

OMG... is ScanCat still around? I purchased their scanning software
many (many!) years ago and never could get it to work properly.

Of the two, I would recommend Butel. (or perhaps even one of the free
applications that one can find on the web.)

Date: 2013-06-05 14:02:37 UTC
From: Michael Hopkins
Topic: 7926 Message: 7981

I agree it doesn't make sense and there may be more to the problem, but right now I've got two systems, each with the same sites (simply copied one to the other) but one has multiple groups of TGIDs (no signals from any site or any TGID) and the other has a single group (much activity on multiple sites).

Next step is to try and split the groups in the working system and see what happens. If it works, then there is some other basic problem that I have yet to discover.

Thanks for the comments.

Get some software, buy a subscription to Radioreference, and DL the
updated data to your SW, then dump it into the scanner.

There set in ROM, and loaded as default. You could download them to your computer, modify or update them, and then upload back to the radio.

Kinda the same as custom programming...

I've been trying to get my BCD396XT to use the weather radio function. Every time I set it to WX Primary it will cause the Police Scanner part to cut during the middle of conversations. Am I doing something wrong or is it normal to be doing this?

7986. Re: [BCD396XT] WX Operation

That is normal. It is sampling the weather
channel to see if there is an alert tone present.

Sounds normal. It is periodically going off to see if there is
activity on the weather channel. Exactly the same as using priority.

Yes it is normal but on this scanner it is a bit more obvious than other scanners that have been made in the past. I have quite a few scanners that have WX priority and yes they too have the pause in regular radio traffic when it checks for WX warnings. But the 396 seems to have a pretty major "check" that can not be adjusted. To some people it is OK, to others it is a little bothersome.

Is it a larger delay on analog channels or only digital? There is a
time delay when reacquiring a digital stream and starting the D-A
conversion.

7991. Re: [BCD396XT] Re: WX Operation

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-10 15:09:46 UTC
From: Milton Engle
Topic: 1295 Message: 7991

The radio can only do one thing at a time. If it is scanning through a list of programmed frequencies, following a trunked system, whatever it can only perform one task at a time and each task involves a certain amount of time. If we are receiving a signal on an analog frequency with weather priority turned on, every 6 seconds (default) the radio will stop receiving, switch to the weather channel, listen for the alerting signal; if heard it will stay on the channel, if not it will return to the previous channel where the conversation we were initially receiving may or may not still be taking place. If a trunked system is involved there is another step involving checking the trunked control channels in an analog or P25 system before switching to the active voice channel. The time to accomplish each task is relatively small, but those small bits of time for each individual task start to add up quickly.

One of my biggest gripes is how the manufacturers keep putting more and more "features" into products but not fully explaining that each "feature" has other dependancies that limit it's usage.

Keep the WX Priority turned off. If you need to keep an eye on the weather I strongly suggest a dedicated WX receiver.

Another "feature" that falls into the same catagory is the Fire Tone-out function. It causes the scanner to mimic the function of a two-tone paging receiver. This function cannot be used with scanning. So now your "scanner" is actually nothing more than a single channel receiver with two-tone decode capabilities and no alerting function. Here again, if you need this sort of dedicated alerting capability get a pager.

From: Uniden UPMan
Topic: 1295 Message: 7992

Weather Priority has been in scanners for 20 years, and has always worked the same way. We do try to cover this in the user's guide...it is actually on the front page: http://info.uniden.com/twiki/bin/view/UnidenMan4/ScannerManuals#Common_Questions

Unfortunately, the DND mode we've added for Priority on our latest models won't work for Weather. There is an 8-second window during which time NOAA transmits the 1050 Hz tone. You must sample often enough that you hit inside that window.

There is a BCTool Yahoo group. There is plenty of help available there.
I've used the program and like it. I don't use it that much of late, so
I can't provide a ton of help.

7996. Bcd396XT unable to pick up FWA airport transmissions

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-21 21:53:38 UTC
From: Michael Weidemeier
Topic: 7996 Message: 7996

My BCD396XT is not picking up commercial aircraft tranmissions at Fort Wayne, International airport in Indiana.. I imported the frequencies from radioreference with proscan. Everything else works fine. I can see FWA come up but I never get any transmissions from planes or the airport. Any solutions would be greatly appreciated. It is a conventional system and is analog.
 Thanks, Mike

Mike are the frequencies in the aircraft band? if so could you check in your proscan (I'm not familiar with this program) and see if it is set to the AM mode.

Date: 2013-06-21 23:55:38 UTC
From: David Johnson
Topic: 7996 Message: 7999

Did a quick search on frequencies, just check these match what you have imported, and that modulation is set for AM:

From ourairports.com:
Radio communication frequencies for Fort Wayne International Airport

A/D: 127.2 MHz (APP/DEP)
ATIS: 121.25 MHz
CLD: 124.75 MHz (CLNC DEL)
GND: 121.9 MHz
OPS: 138.4 MHz (122FW COMD POST OPS)
RDO: 122.2 MHz (TERRE HAUTE RDO)
TWR: 119.1 MHz
UNIC: 122.95 MHz (UNICOM)

Subject: [BCD396XT] Bcd396XT unable to pick up FWA airport transmissions

My BCD396XT is not picking up commercial aircraft tranmissions at Fort Wayne, International airport in Indiana.. I imported the frequencies from radioreference with proscan. Everything else works fine. I can see FWA come up but I never get any transmissions from planes or the airport. Any solutions would be greatly appreciated. It is a conventional system and is analog.
Thanks, Mike

Topic: 8000 Message: 8000

I did a search on the archives but could not find any info. From Radio Reference I found that the freqs are FM. I am trying to receive transmission from DTW (Detroit Metro) and have not been successful. I have the following:

DTW Approach 118.575 Mod: AM AudioType: All
DTW Tower 118.4 Everything else same as above
DTW Tower 135.000

I have them in a conventional site.

I am sure I am doing something wrong as I am new at this. I appreciate help.

Thanks.

Mike

If they are between 108-136 or between 225-380 they should be AM.
Most everything else will be FM (more accurately NFM these days).

It appears you need an AM setting.118-136 MHz are AM for your purposes. They use AM deliberately instead of FM so they can better determine when two or more planes try to transmit at the same time. Two or more AM signals at the same time create hetrodyning, a squealing, which alerts the air traffic controllers there is another plane trying to talk. This is so they don't miss the other planes transmission. In FM mode the stronger signal usually covers the weaker one and the weak one is not noticed.

But wouldn't the 936 be a logical progression in model numbers? I'd think that would be the one to watch.

From: Don.Curtis@att.net
Topic: 8015 Message: 8015

How far are you from the airport? VHF signals such as aircraft are strictly line of sight. Meaning if you're not within about 15 miles from the airport, you'll never hear the tower or ground control.

However, you should hear the aircraft as they approach the airport.

I would suggest you set the scanner to service search in the aircraft band and see what you do hear, and then decide which frequencies you wish to monitor.

Also, open the squelch until you hear noise, then close it to just past where the noise goes away. If you have the squelch too high, you'll pretty much never hear anything on AM.

Anything is possible, but it would be the first time Uniden
has released multiple models at the same time if it's true.

From: Bob Arenella
Topic: 8003 Message: 8017

If it's a handheld scanner.....Think smaller,
PLEASE! If kenwood can stuff a tri bander with wide band, all mode RX in a package 2/3 the size of the 396XT.....and the TH-F6A has been on the market for many years. Someone at UNIDEN must be familiar with SMT :>)

AH! I am about 40 miles away. Right now I do not her either tower or airplane. I just tried the service search and still did not get anything.

Thank you for your help. Any other ideas?

Mike

You should be able to hear planes that are on the air. As for the tower
and planes on the ground, very doubtful. They transmit way too low power
to be heard very far on the ground.

Some of the business and PS frequencies might carry that far. I'm about
40 miles from a major airport and while I cannot hear the tower at all,
I can hear some of the PS and business users. Some of the users there
are too weak to hear this far out, too. Planes in the air are little
problem.

As Don said - think line of sight for aircraft frequencies.

I live about 20 miles as the crow flys away from the airport and find in order to hear the tower I needed an outside antenna. I went with a Grove Scanner Beam and a rotator. My location has a couple of ridges in between so I needed to overcome loosing the line of sight advantage. Don't forget, the tower always has line of sight going for them, a straight shot to the planes, reducing the power level needed. So you need to overcome the ground clutter (trees, foliage, hills, buildings, etc.) that get in the way.

External antenna, especially if you're on the lower floors of a building with brick or metal walls. Open up squelch as I noted before.

Also here in Los Angeles. Lots of businesses are changing to TRBO.
The very recent shooting here in Santa Monica College is an example as the College PD recently changed to TRBO and no other
PD could communicate directly with them.

What Joe said is accurate... I can hear planes 40 miles to the south of me as they come in to land to an airport (EOS) 30 miles to the south, but can't hear the tower at all. There's another airport just 5 miles to the north of me (JLN), but it has a lot of static and is very hard to hear. I can hear the planes on the ground there with about the same quality. This is with an Scantenna on a (temporary) 10 foot mast outside.

Topic: 8003 Message: 8031

Gary,

AOR is probably the most expensive scanner out there today. If you do a Google search for AOR you will find their site. But as their gear is considered of a professional nature, I would categorize them as "very high", price wise. Therefore I would guess your inquiry has to do with UNIDEN, Radio Shack, and GRE scanners... Their high end scanners. GRE is in limbo presently-they lost their manufacturing operation in China and have notified all that they are in the process of relocating but nothing new as yet. They offer a model PSR 800 portable radio which I believe has one more of the APCO Project 25 protocols than the UNIDEN products. (UNIDEN is currently developing a new model which may include this protocol, more from Uniden later this month or next.) Radio Shack has their brand manufactured by GRE and offered "like" scanners, GRE and Radio Shack models are very similar with minor differences. But Radio Shack also carries UNIDEN products.

So to answer your question, the high end scanners available from UNIDEN are currently the HomePatrol-1, the BCD996XT and the BCD396XT. The GRE line currently offers amoung others, the PSR800, if you can find one.

My guess is that you are new to scanning and have just started the research process. With this assumption in mind, my suggestion would be to first identify what you wish to monitor, determine what types of systems their communications use and pick a scanner that is capable of receiving the systems (are the systems of a trunking nature and what protocol are they using-if it's a proprietary trunking system it will not work on any commercially produced scanner due to laws prohibiting their manufacture or modifying them). Are any of the systems encrypted? Again, to modify a scanner in order to make them work on a deliberately encrypted system is illegal. Ideally, finding someone who has a working scanner in your local and asking them for help is the way to go. if there is a volunteer fire department in your town or close, you might inquire of them who is the local scanner buff. Some Radio Shacks also offer assistance, but beware of someone telling you anything just to make a sale. Once you have that research in hand you can determine if you wish to purchase a scanner. An example of what I mean is as follows; someone wants to listen to the local police and buys a scanner that is capable of receiving the frequencies the local police use. But the police use either an encryption and/or a proprietary trunking system. The scanner is not capable of hearing any intelligent communications from the police. So that scanner purchase was a bad investment. Unless there are other services which the scanner CAN track and hear which are of interest to the buyer.

So do your research in order to make an intelligent decision. This group is here to help (As it has helped me and countless others) but you can aid in that process by learning some of the basics first. There are numerous sites online that explain the hobby, both the pitfalls and advantages of it and I ask the group to volunteer these online sites for you as it's been many years since I have had the need to refer to them and don't remember.

Hope this helps

I wouldn't want smaller! The buttons are a pain as it is and making them smaller means smaller buttons and display. Keep the size as they are!

8035. RE: [BCD396XT] Bcd396XT unable to pick up FWA airport transmissions

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-23 19:15:19 UTC
From: Michael Hopkins
Topic: 7996 Message: 8035

Don't know how far you are from the airport, but to hear most of what you have listed you'll need to be pretty close - 10 miles or so unless you have a tall tower for your antenna. I've got an antenna on a tower about 35 feet in the air and can hear tower frequencies for airports about 15 miles away but a few I can only hear with a pre-amp between the antenna and radio. Others closer to me (Manchester NH and Nashua NH) are about 15 and 5 miles away respectively and I can hear all the frequencies.

Try these approach frequencies for your area.

127.2 SW TO NW

132.15 SE TO NE

Same frequencies are used for departures.

Indianapolis center Frequencies - aircraft will be at high altitudes -- to try:

132.525, 128.3, 120.65, 134.175, 132.2 128.4 119.475 Some of these might work

Good luck

Did a quick search on frequencies, just check these match what you have imported, and that modulation is set for AM:

From ourairports.com:
Radio communication frequencies for Fort Wayne International Airport

A/D: 127.2 MHz (APP/DEP)
ATIS: 121.25 MHz
CLD: 124.75 MHz (CLNC DEL)
GND: 121.9 MHz
OPS: 138.4 MHz (122FW COMD POST OPS)
RDO: 122.2 MHz (TERRE HAUTE RDO)
TWR: 119.1 MHz
UNIC: 122.95 MHz (UNICOM)

Subject: [BCD396XT] Bcd396XT unable to pick up FWA airport transmissions

My BCD396XT is not picking up commercial aircraft tranmissions at Fort
Wayne, International airport in Indiana.. I imported the frequencies from
radioreference with proscan. Everything else works fine. I can see FWA come
up but I never get any transmissions from planes or the airport. Any
solutions would be greatly appreciated. It is a conventional system and is
analog.
Thanks, Mike

Only a couple models prior you couldn't
fit any scanner in your short pocket.

Thinner would be nice, though.

Actually, you could pipe the speaker audio out of the top with
minimal loss of fidelity, so you could make it shorter, too.

You could also combine the keys with the
display (touchscreen) making the unit smaller.

If he thinks the 396 is a brick he'd have thought a few handheld radios and scanners I have had were boulders! I think the one scanner tipped the scales at 6 or 7 pounds!
A friend once used his to take down a guy who was running from him. Knocked the guy silly long enough to get the cuffs on. The good old days! Didn't hurt the scanner either.

Perhaps you should sell it in anticipation of the new product line...

Compared to the GRE Radio's I'm happy it's a solid, compact radio,
and not a boat anchor to lug around...

Subject: [BCD396XT] Airport Scanning

I did a search on the archives but could not find any info. From Radio Reference I found that the freqs are FM. I am trying to receive transmission from DTW (Detroit Metro) and have not been successful. I have the following:

DTW Approach 118.575 Mod: AM AudioType: All
DTW Tower 118.4 Everything else same as above
DTW Tower 135.000

I have them in a conventional site.

I am sure I am doing something wrong as I am new at this. I appreciate help.

Thanks.

Mike

Lithium ion rechargeable battery perhaps? With something like a mini
USB charging port and sync so we don't have to keep buying proprietary
cables, or computers with COM ports.

8045. Freescan files?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-23 22:42:21 UTC
From: vbwyrde
Topic: 8045 Message: 8045

Hi,

The BCD396xt is great but a bit over budget. I would like to know how I can get the trunking frequencies set up... I see I could add them manually, or use freescan to do that automatically. In the software there's a option for uploading the files. Yet I don't see how I can get the files for uploading from the website without paying for it. Is it poor form to ask if there happens to be a way to get the files without having to pay the semi-annual fee? It's pretty expensive and I'm likely to only want to use it for a first time setup anyway, which means I'd pay what seems like a lot. Or am I kinda stuck with adding them manually, which would be a bit tedious, but doable. Just wondering. Trying to cut costs, and save time both here. If possible. Thanks.

Frrescan has a feature called, "EZ Grab"

It will let you do a cut n paste from Radio Reference by merely highlighting what you want.

You can use EZ-Grab which requires that you copy the data on the
webpage, click the EZ-Grab button, import the data to the screen, then
import it to the scanner.

If your time is worth anything, and you have more than a few systems you
want to import, you are much better off simply paying the money so you
can select which systems you want and import them directly.

USB typically does not supply enough current to charge the scanner in
any reasonable amount of time (say a few hours). This is especially true
if you want to use it at the same time.

As for the COM ports, no Uniden scanner made in the last several years
programs with serial ports (which is unfortunate, as that introduces
continual mandatory updated drivers, as some people are discovering with
Windows 8 incompatibilities).

I don't know why some people keep pushing USB as the answer to anything.

My iPad charges via a 2.1 amp USB connection. All of my USB outlets in my car output 2 Amps. This is more than enough to charge the scanner in a reasonable time if it has a lithium ion battery.

Not sure what you're saying about com ports. My 396XT and 996XT both have an RS232 programming interface. To use it, I needed to buy a USB to RS232 converter which has its own series of problems with newer operating systems.

Sent from my iPhone

Try plugging that cable into your PC and see what it tells you.
(hint: they can only supply 200 mA max - sometimes less)

As for the COM ports, I said nothing made in the last several years uses
serial. 396XT and 996XT were both made in 2009 - 4 years ago.

The problems you mention with adapters are driver issues. The exact same
driver issues you would have with a USB scanner. But, while you can fix
an adapter by (worst case) spending a couple bucks on a newer adapter,
you would have to spend several hundred dollars on a newer scanner for
the same fix.

It should be interesting to see how GRE fairs in this regard. I think,
and I hope, there are enough people devoted to GRE that they will
continue to supply updated drivers. But, every product has an
end-of-life date after which they are no longer supported. Just try
getting a volume knob for a BC780XLT these days.

Fact is as long as Uniden continues to be GPS compliant, serial will be
a way of life, as that is the NMEA specification. (Not saying they might
not support both as with the HomePatrol)

The only advantage to USB is speed. Granted, that is a big advantage,
but it also typically means a reduced service life.

They might if they had lithium batteries. I can power my HTC Rezound via the micro USB port while running it. Doesn't the PSR 800 use a mini USB port for charging?

>
> As for the COM ports, no Uniden scanner made in the last several years

The Uniden USB-1 is a serial to USB adapter. I don't use that, but I do use serial to USB adapters for my 364XT, 396XT, and 996XT. Even even most of the GRE scanners use a USB to serial adapter, even though it's built into the cable like the USB-1.

The only problem with Windows 8 is with a few Prolific chip sets. Even my 10 year old FTDI chip set adapters work fine.

>
> I don't know why some people keep pushing USB as the answer to anything.

Because it's an incredibly flexible standard that happens to be, uh, universal. Phones, GPS, even the Harmony TV remotes use it.

It has nothing to do with the battery type (chemistry). The USB 2 standard specifies 5v @ 1/2 amp MAX, for a standard USB port. Try plugging your Rezound into a computer and see how long it takes to charge.

Phones & other devices do not use "standard" USB power supplies.

What all USB devices have in common is the signaling on the DATA pins and 5v for the power pins. But not the amperage they draw from the power pins.

<DaveL> If USB was truly universal, there would be no need for host devices and drivers.

I operate multi-million $$$ machinery that is programmed using Serial Protocol only. Even the Electric Fork Trucks are serial.

No need for drivers and host devices. Serial is a STANDARD. No support needed for compatibility with various OSs. Believe or not, Serial Protocol is not going anywhere, especially for manufacturing machinery.

One of the largest current drains in a scanner is the audio amp - often consuming more current than the cell charging does. (or giving it a good run for the money with the volume up)

Yes, I think the 800 uses USB to charge, but it also locks out use while it does that since all the current is going into the cells, which takes over 16 hours, BTW. I tried to find out the capacity of the OEM cells, but maybe it doesn't come with cells since I can't find any specs on it. The 800 might allow use if you use an external source that is capable of sufficient current, but the charge time is still 16 hours. Again, PCs don't supply enough current for scanners.

Regardless, this still does not address a critical issue - the fact that no scanner made yet charges NiMH cells the correct way (LIon would be the same). Unless than changes, how the scanner charges is irrelevant since charging the cells externally is the best way to charge them. I don't even know where the chargers are for any of my portable scanners.

I wasn't talking specifically about the USB-1, but other scanner models as well. In fact, just about anything that is USB will have driver issues if the drivers are not continually updated for the various operating systems out there, and Microsoft is known for "breaking" such things.

> The only problem with Windows 8 is with a few Prolific chip sets. Even
> my 10 year old FTDI chip set adapters work fine.

Good news for FTDI. But, from what I've heard they must be the
exception. I hear a lot of issues that come down to driver issues.

>> I don't know why some people keep pushing USB as the answer to anything.

"Universal" is relative. The intent with the term was to be that USB
would work work anything (which was never meant to include charging,
BTW). In reality, the drivers required for each OS makes RS232 much more
universal that USB.

With flexibility comes the chance to mess something up. Or to quote
Scotty "The more they overhaul the plumbing, the easier it is to stop up
the pipes" (or something very close to that).

I would love a manufacturer to tell me that 20 years from now my new
scanner will still work on my PC. Don't hold your breath for that.

My 25 year old radios that are serial based work fine with any PC with a
serial port. I don't expect new USB-based radios to be supported 10
years from now.

Currently, USB-3 is backward compatible with USB 1/2, but I wonder how
long until that convention lapses and USB is perhaps even replaced in
favor of "the next big thing".

How about an Ethernet port?
With the ability to take both Static and Dynamic IP address.
So I can place the any number of scanning radios anywhere I want on my home network
and be able to program/control those radios from any computer on my home network.

Thanks.......and Keep Safe!

USB3 low power spec is 150 mA max. There is a high power port which must use a connection to the power supply which will provide up to 900 mAH.

Is is also worth noting that the USB3 spec is between 4.45V and 5.25V so you may not even have sufficient current for a 5V device. I've also read a spec that allows down to 4.0V for USB3.

Of course, it's never a good idea to run any device at maximum current capacity for several hours on end, let alone 16 hours or more. That develops heat and heat is the mortal enemy of electronics.

USB, in the original designs, was never meant to charge higher draw devices, these devices were set up to use the existing cables etc after the fact. While a higher power device like an iPad may charge on a USB port it would take much longer than if one used a higher wattage charger. This is why most devices that require higher charge rates come with 10 watt chargers, like the iPad.

Should scanner manufacturers decide to switch to USB charging and require a higher rate/faster charge they should include a 10 watt charger. Otherwise they should accommodate charge rates that are going to be slower due to limited power output from most computers on their USB ports.

Uniden may also want to look at the various USB GPS devices or sell their own for those devices that use them. They could develop an internal one for scanners with provisions for external antennas, perhaps even go so far as to sell a combination GPS/Scanner antenna for vehicles.

By converting to the relative standard of a micro USB or the older mini USB (as they did on the BC125) they could allow the use of the thousands of USB chargers, cables and other devices already on the market. They would still need a driver set, but like the HP1 that could be included on the memory card built in to the scanner, should it be so equipped.

That's actually a great idea, but let's take it one step farther.

We keep talking about serial vs USB when we perhaps should be talking about wired vs wireless. Bluetooth or some other means of communication that won't be dependent on any physical connection. The reason I like Bluetooth is because you could add support for the earset that you use with your phone. You could even use both at the same time. I do that now with my XT through a Bluetooth dongle. I've also recently purchased a speaker mic for use with my XT which has much more audio than the scanner itself. Of course, range of either is limited. Just about every piece of electronics I've purchased in the past few years has a WiFi connection for one reason or another. TiVo (OK, mine may use ethernet, but they sell a WiFi adapter), Xtreamer (has WiFi but I use ethernet since WiFi does not have the capacity to stream HDTV signals), DVD players, other media players, Wii, TVs, even some of the appliances are coming with internet connectivity.

Of course, none of these devices have to worry about RFI. That will be the trick if any form of transmitter is incorporated into a scanner. You will have to keep it from interfering with the reception.

One possible solution is Magnetic Resonance. I have a speaker mic that uses that for short range communication (from the speaker mic to the radio). BUT, I have had interference with it on 800 MHz trunking - both receive AND TRANSMIT interference! Still, it's something new that is very secure.

All of which go right back to the same Prolific chipset. I did a lot of research on the issue when I bought my Win8 laptop. I think there are even a couple of threads about it on Radioreference.

RS232 is dying outside of a few industrial uses. Certainly for consumer grade products, it's rapidly going away.

Of course. When they make items with a shorter lifespan, that means more
overall sales. Why wouldn't the manufacturers want that?

>> I would love a manufacturer to tell me that 20 years from now my new

There is a difference between promising product support and predictions.
Asking a manufacturer for a commitment for X years is not only
reasonable, it is an excellent act of good faith.

In my opinion anyone who purchased something with no confidence of
support after the next model comes out is the fool. I'm not calling you
a fool - I'm just saying that support after the next model comes out is
something everyone should expect - even after the next several models.
To use a specific example, Uniden went back several models (4 I believe)
when they issues rebanding updates. Granted that is only about 10 years,
but I use my scanners much longer than that.

Given that the Icom ID-51, Kenwood TH-D72, and Yaesu VX-8G amateur
radio handhelds have internal GPS receivers as standard equipment, I
don't know why Uniden couldn't produce a handheld scanner with the
same feature. Yes, it would be an added cost that would have to be
borne by the consumer.

Which leads us down a different path. Can the scanning community
support an even more expensive scanner than the HP-1? Is there enough
of a market to justify the development, testing, and production of
such a scanner?

Bob...

The history of scanners, as well as computers and all other electronics has basically been adding new features and capabilities while retaining a steady cost, which, with inflation, is actually cheaper over time. This would make the addition of a GPS more palatable now.

Look at the BC780. A huge success in it's day for it's great feature set, channel capabilities etc. It ran about $500 10 years or so ago when it was introduced. It has been replaced several times over by newer radios with many more features and capabilities but the premier scanner prices from Uniden remain about the same $500.

While I have no idea if Uniden plans to introduce any of the features discussed in this or other threads, you can bet pretty confidently that there will be more features and capabilities for probably a similar price. Internal GPS and USB connectivity is possible at the same price point, but there may be other ideas (P-II etc.) that might be included instead...

8068. General comments about Uniden, Charging batteries and such

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-24 01:25:30 UTC
From: neilbell99
Topic: 8068 Message: 8068

First off, I am a long time scanner user from the old crystal based scanners to my 396XT and 996XT.

I agree fully with Joe about using external chargers rather than depending on built-in charging. Rechargeable batteries come in several technologies and one must be sure their external charger will do a proper jobs for the batteries they use. Also his comments about the audio circuits and speakers using a lot of "juice" compared with the actual scanning battery drain.

I do expect scanner manufacturers to provide some support for the current models when a new system hits the market. Not forever but at least for a few years. Generally Uniden has done a very good job with this. Consider GRE -- the users of PSR-500 and 600 are now left with no support, no service facilities and no promise that this will be rectified.

I feel lucky that I sold my two GRE PSR-500 and 600 scanners. Sadly, the PSR500 went to a good friend and within 2 weeks had a belt clip failure and the scanner hit the floor. Unless he can find someone to fix the scanner he is out the $$$ he paid me and has a scanner "brick". I feel very bad about that.

I sold my GRE scanners because I feel that Uniden (and product manager UPMAN) care about users and have a superior product overall. There were some features in the PSR scanners that I liked but there were far more in the XT series from Uniden.

In my opinion buying any scanner from GRE (including their latest PSR-800)is taking a real risk about future support and repairs. I doubt that the GRE folks really read the user groups postings like I know that Uniden does. I have no connection with Uniden, I am not a beta-tester for them but feel confident they will continue to develop and support scanning products.

I also have to say that Joe's comments and opinions add significant value to discussion boards and I respect his views greatly.

Neil Bell, KJ6FBA, and an 80 year old radio nut!

Yes, I'm sure you do, but I will bet dollars to doughnuts, that it takes much longer to charge via a laptop or desktop.

5v @500ma = 2.5 watts

As you or someone else mentioned, the typical iPhone or iPad charger is closer to 10 watts and thus should charge it 4 times faster (all else being equal).

> > The BCD396xt is great but a bit over budget. I would like to know how I can get the trunking frequencies set up... I see I could add them manually, or use freescan to do that automatically. In the software there's a option for uploading the files. Yet I don't see how I can get the files for uploading from the website without paying for it. Is it poor form to ask if there happens to be a way to get the files without having to pay the semi-annual fee? It's pretty expensive and I'm likely to only want to use it for a first time setup anyway, which means I'd pay what seems like a lot. Or am I kinda stuck with adding them manually, which would be a bit tedious, but doable. Just wondering. Trying to cut costs, and save time both here. If possible. Thanks.

That might be an interesting journey.
Perhaps the new models will make this year's CES show in Vegas.

Thanks again Paul for your patience, and participation in the user side of these products.

HI,

How much power does a ATC Tower put out?

What does a comercial airline, Mil Aircraft, private plane put out?

Also what is the power of there ATIS and beacons in the 108 to 118 MHz band put out?

Best Regards
Sincerely,
Ted

How far are you from the airport? VHF signals such as aircraft are strictly line of sight. Meaning if you're not within about 15 miles from the airport, you'll never hear the tower or ground control.

However, you should hear the aircraft as they approach the airport.

I would suggest you set the scanner to service search in the aircraft band and see what you do hear, and then decide which frequencies you wish to monitor.

Also, open the squelch until you hear noise, then close it to just past where the noise goes away. If you have the squelch too high, you'll pretty much never hear anything on AM.

AH! I am about 40 miles away. Right now I do not her either tower or airplane. I just tried the service search and still did not get anything.

Thank you for your help. Any other ideas?

Mike

You should be able to hear planes that are on the air. As for the tower
and planes on the ground, very doubtful. They transmit way too low power
to be heard very far on the ground.

Some of the business and PS frequencies might carry that far. I'm about
40 miles from a major airport and while I cannot hear the tower at all,
I can hear some of the PS and business users. Some of the users there
are too weak to hear this far out, too. Planes in the air are little
problem.

As Don said - think line of sight for aircraft frequencies.

I live about 20 miles as the crow flys away from the airport and find in order to hear the tower I needed an outside antenna. I went with a Grove Scanner Beam and a rotator. My location has a couple of ridges in between so I needed to overcome loosing the line of sight advantage. Don't forget, the tower always has line of sight going for them, a straight shot to the planes, reducing the power level needed. So you need to overcome the ground clutter (trees, foliage, hills, buildings, etc.) that get in the way.

External antenna, especially if you're on the lower floors of a building with brick or metal walls. Open up squelch as I noted before.

Anything is possible, but it would be the first time Uniden
has released multiple models at the same time if it's true.

It would be fantastic if any of the new scanners could allow us to hear
TRBO, her in Aust there are so many users moving from conventional PMR to
the TRBO format

Also here in Los Angeles. Lots of businesses are changing to TRBO.
The very recent shooting here in Santa Monica College is an example as the
College PD recently changed to TRBO and no other
PD could communicate directly with them.

If you have joined the new groups, they might be better places for
speculation and request. From what I understand from the post on
Radioreference, the design is not fixed yet. And Paul Optiz has been
reading the various "What I want in the next Uniden scanner" threads.

8081. Re: [BCD396XT] Digest Number 1105

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-24 22:55:12 UTC
From: MCH
Topic: 8080 Message: 8081

Great question. I believe 10W is typical, but I have seen
licenses with as much as 50W. I believe ATIS/AWOS is the same.

Not sure about the VOR beacons.

> I live about 20 miles as the crow flys away from the airport and find in order to hear the tower I needed an outside antenna. I went with a Grove Scanner Beam and a rotator. My location has a couple of ridges in between so I needed to overcome loosing the line of sight advantage. Don't forget, the tower always has line of sight going for them, a straight shot to the planes, reducing the power level needed. So you need to overcome the ground clutter (trees, foliage, hills, buildings, etc.) that get in the way.

8083. Re: New YahooGroups for the newer Uniden Scanner Models

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-25 12:26:27 UTC
From: Bill
Topic: 8003 Message: 8083

So from what I gather from Upman there is only one new product he can attest to at this time, stating in a few months time UNIDEN will be announcing. True, the posting from whoever created all those new user groups may have had the effect of beating UNIDEN to the punch, but creating all those other groups seems premature, irresponsible. No different than me dreaming up a new model Maytag refrigerator and creating a users group for it. How long does a fictitious user group live before the Yahoo Groups dumps it? And why (especially in this case where numerous groups were created) didn't Yahoo Groups consult with UNIDEN before allowing their creation? It seems to me that all that has occurred is some beta tester had their email violated and information of a sensitive nature (intended for only within the UNIDEN beta testing community) was posted out in the clear, with the creation of a bunch of new user groups, stealing Upman's thunder. Upman responded to the false reporting with factual information to set the record straight. Now it's finished. Calling Upman a liar over the hacking or no hacking issue is pure bull. And to post such a response, be it in the form of a question or accusation, is just plain irresponsible. Paul Opitz should have simply dispelled any question of a new model(s) with the tried and true reply of "When a new model is to be introduced it will be announced by UNIDEN." He might add something to the effect of UNIDEN is a progressive company and always has various projects in the pipeline, noting that to make announcements before a final commitment to manufacture is irresponsibly premature. (I know he has that listed in his "rules" section but there is a need to restate the policy from time to time.) Paul did confirm one model (when he didnt have to) and I thank him for that. The rest of us must remember beta testing is just one step in the production of new gear. And although it is one of the last steps used in proofing the gear, It does not mean absolutely that gear will ever see the light of day. Bottom line, when I see it on the store shelves its hardware, not spoofware.

A question for Paul... How does one become a beta tester? I am interested in pursuing the possibility, having owned the vast majority of scanners from the beginning, running comparisons of different make and model. AOR, Regency, GRE, Tennelec, Bearcat and UNIDEN. In effect, beta testing, and realizing there is a lot more to the beta test process, I would very much like to submit valued input at that level.

8084. Re: [BCD396XT] Re: New YahooGroups for the newer Uniden Scanner Models

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-25 14:30:45 UTC
From: Uniden UPMan
Topic: 8003 Message: 8084

Actually, we start beta testing very early in the development process. In this case, well over a month (maybe 2 or 3 months) before any beta tester even has hardware to beta test.

I brought this practice to Uniden with the BC246T. Had a heck of a time talking the engineers into it, and even then it was only on what we call FPP (First Pilot Production) which is a 100-unit run we do about a month before mass production. Beta testers were invaluable in finding dozens of bugs. I actually held the first shipment in our warehouse until we finished a revised firmware load, then we reflashed everything before sending any out to our customers.

Why so many bugs (and why are there still occasional bugs despite beta testing)? Unlike telephones, which work pretty much the same way everywhere in the US and have only a single set of technical standards to follow, scanners work differently depending on where you are and what you want to listen to. And, there are as many industry standards as there are types of radio systems (and some of those "standards" are so loose that different systems operating under the same standard can still behave quite differently). How you use a scanner can differ significantly from how your next-door neighbor would use it...and dramatically from how someone the next state over would use it. With so many usage scenarios, I've come to peace with the fact that we'll always find one more thing (well, sometimes two more things) to fix once they hit the wide world. Oh, and my wanting to continually add new features doesn't help things, either. :)

On the next model, engineering requested that we start beta test shortly after what we call WS (Working Sample) stage -- which consists of 2-3 samples made from prototype boards and 3D printed parts. I sometimes create the beta test group before even that stage so that the testers can be familiar with the basic architecture (and in some cases help to polish the details of the architecture) long before they actually have hands-on. On any particular project, I have between 10 and 20 beta testers. I originally used the following selection criteria:
* Must have a professional radio affiliation (works for a radio shop or uses two-way or scanner radios as a primary adjunct to their profession). i.e. Not a pure hobbyist.
* Must not have a history of posting nonsense in forums. :)
In addition to the above, I occasionally will ask someone who has posted about a specific issue that we are investigating to beta test against the problem. If my experience with them is positive, I'll consider them for future projects. In 10 years, I've only had to kick one person "off the island" and he was someone who falls into this last category. He posted confidential materials we had specifically advised were not to be released...I had to spend a chunk of an evening resetting passwords on several servers.

We currently have several radio system engineers, some law enforcement personnel, and a stew of additional testers both with and without professional backgrounds (including a former anti-Uniden "agitator" who's criticisms were not nonsense and who was willing to positively engage with us to address the problems he was reporting). Most of the beta testers from the "Class of BC246T" are still active testers, and I've added a few others, since. But, in general, I don't typically have beta test opportunities that I cannot take

care of with my current stable of testers. When I do, I write down attributes I need (proximity to particular systems or system types, type of scanner "listener", etc) and typically reach out to someone I can identify who meets my criteria. I don't believe that I have posted a "call for beta testers" since the BC246T days (when I sorted through over 100 applications to get down to 10 testers...).

8085. RE: [BCD396XT] Air Band Radio Power

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-25 14:22:38 UTC
From: Michael Hopkins
Topic: 8080 Message: 8085

MODERATOR NOTE: I changed the subject to a meaningful title and deleted the multi-page digest. When replying to a message in the digest, please make the subject line meaningful and trim the digest down to only the relevant post you are replying to.

My piper Warrier II had a 25 watt radio; Garmin commercial radios range from10W to 25W --- one model was selectable at 10W or 16W.. but be careful about the specs... some are spec'd at 16W but are 5W carrier and 16W PEP (Peak Envelope Power - the power in the AM Sidebands that carry the audio information). Bendix KLX 135A is 5W (7W nominal); Bendix KY 196A, pretty common, is rated at 16W (probably PEP).

ATC radios are about the same power levels. You can imagine the problems at a large airport if high powered radios were used all operating at close range for multiple Tower and Approach frequencies, ATIS, Ground control, clearance, terminal ops, maintenance, ground vehicles, etc..

I wasn't able to find anything about VOR power levels (108 TO 118MHz) but there is quite a bit of data on their characteristics and ranges:

Terminal VOR - 1,000 to 12,000 feet 25nm (nautical miles - statute miles divided by 1.1)

Low Altitude VOR -- 1,000 TO 18,000 feet to 40nm

High Altitude VOR - 1,000 to 14,500 to 40nm; 14,500 to 60,000 to 100nm; 18,000 to 45,000 to 130nm.

As you can see, you need some altitude to hear VORs at any distance. You can hear them pretty well on the ground if you're within a few miles of one. By the way, these are located all over the map and not necessarily at airports...

I haven't seen data on ATIS transmit power, but I can tell you on the ground you need to be within a few miles generally, but I can hear ATIS from about 30 miles from relatively small hills.

8086. Re: [BCD396XT] Re: New YahooGroups for the newer Uniden Scanner Models

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-25 22:34:07 UTC
From: Rich Carlson
Topic: 8003 Message: 8086

Yahoo has very little to due with the name, content and operation of its many YahooGroups, the fact that Uniden is not involved in most of the groups related or discussing their scanners is of no concern to Yahoo.

YahooGroups are created by individuals who may or may not have any official relationship with the product(s) under discussion and Yahoo does not confer with the product manufacturers before or after the groups are created.

Any Yahoo member may create a group for almost any subject matter regardless of their affiliation with the product(s) discussed. I have created many various groups and participate in a couple hundred others. It isn't hard but requires effort and time.

The groups are not "fictitious" as long as they do not purport to be official or claim sanction from Uniden where it does not exist.

While I don't know for sure the motivations of the person who created these groups, it may be no more than anticipation of upcoming model numbers, or desire to make sure the groups are well run. I know of the guy who created at least one of these groups (I assume he created the others as well) and he is a well know hobbyist who runs dozens of groups and has always been a friend to the hobby. It is my assumption that these groups are created with the intention of allowing discussion, good and bad, of the radios, and I base that assumption on the behavior of the other lists that have been created by the same fellow.

Once the product name is "out there" it was a pretty good idea for him to gather up the YahooGroups so that there is a reasonable person running them. This prevents trolls from going out and grabbing them in the same vein of domain trolls. At least now we know that the group will remain on-topic and relevant.

8087. Re: [BCD396XT] Re: New YahooGroups for the newer Uniden Scanner Models

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-25 23:13:53 UTC
From: John Stark
Topic: 8003 Message: 8087

Don't know if one or all these new groups are fictitious or not but yahoo and I assume Uniden could care less as long as no information slips out that shouldn't until Uniden, and specifically UpMan says its official and info is released by him.
I don't see anything wrong with making up groups for actual or even speculated on scanners. What DOSE irk me is that someone would release information gained illegally and using very poor judgement go post it all over the internet like he's some kind of hero when in fact he is the exact opposite. If he's an armature radio operator this kind of thing is an ethics violation and his license could be yanked. No matter what this person knew better and instead of doing us a favor he gives us in the hobby all a black eye. And jeopardises future products and not just from Uniden. People wonder why encryption is growing so rapidly and this person is a prime example why and why some departments can't or won't trust the public or scanner owners. Then this same person will be the first to cry when their local departments go encrypted and he can't listen any more.... maybe if he kept his big mouth shut they wouldn't have gone encrypted!
As for the person who called Paul a liar, they need to get a life. One thing Paul won't do is lie, especially on a public forum as his job depends on honesty and integrity with the public as well as his company. There are things Paul can't talk about and there are things he can, that does not make him a liar. It makes him a company man doing his JOB! Paul didn't have to say anything when the info got out about a yahoo group but he did and instead of calling him a liar people should be reading his post on RR about TRUST and not bashing him. He really doesn't need to spend all the hours he does helping people on lists but he dose it because he CARES not only about the product but those who purchase those products. He listens and helps. And things are much better in the hobby because of Paul's efforts.

Just my two cents..

From: RJH
Topic: 8089 Message: 8089

Hi,

I have to agree with Don. Moderator please refer speculation to the new lists I don't really care about vaporware and probably most people here don't.

As Paul stated there won't be any hobbyists on the Beta Team although hobbyists probably make up most of the profit, so wild speculation and new ideas are just hot air.

I think too many lists were created, probably so no one would beat Joe to the punch, what's the point of having the lists if people are cluttering up the present lists with the same thing.

Please Joe, send them to the new lists. When the new scanner comes out, most of us will decide, based on it's merits to purchase or not. In the meantime, thankfully, most of us have more important things in our lives than chatter about something that doesn't exist.

Ray

8090. Re: [BCD396XT] Please go to new lists

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-06-26 18:57:45 UTC
From: MCH
Topic: 8089 Message: 8090

The fact that lists exist is irrelevant. It was a third party who was promoting them on other forums. They were never purported to be anything more than speculation. In fact, there is no reference to Uniden whatsoever on them! And yes, the place for non-396XT matters is on a list other than this one.

And when we are coming into an airport at 40,000ft we park the Center Comm radio on the ATIS and it usually breaks squelch in the neighbourhood of 200+ nm.

Antenna height is everything!!:)

Hello Group,

Using FreeScan --- to load freq's into 396xt.

Q: How does one setup FreeScan to decode NAC codes?
Like 171.6125 NAC167 FBI or 410.800 N798 Federal Protective Service.

Thanks for the information.

Greg

Set the NAC under the NAC field. Make
sure you don't have "simple view" enabled.

Hi Joe M.

Found the NAC Tab Field.

Q: Does the radio find the NAC used, or do I need to enter them in?
If the radio finds the NAC as it scans on auto pilot, what setup settings
are needed, if any?

Thank for your time and interest.

Greg

The scanner will search NACs.

I think how you set it up in FreeScan is to set the
channel to DIGITAL ONLY and enter SRCH in the NAC field.

If that doesn't work, set it to digital only with SEARCH selected for
the NAC, then read that into FreeScan to see how it is interpreted.

8096. Programing Question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-01 22:11:36 UTC
From: Steve
Topic: 8096 Message: 8096

Hello all,

I am new to the group and just bought the BCD396XT.

I want to program in some Digital (P25) conventional frequencies in a county and am a little concerned on how to.

Knowing it is Digital (P25) conventional, when I set up a new system the scanner asks what kind of system to choose (MOT, EDACS, P25, Conventional and one other thing that I cannot remember).

Do I choose P25 which then asks if I want traditional trunking or single Frequency or do I just choose conventional, then add the frequency and under audio options make sure that it is set to Digital only (I suppose Analog and Digital would work)?

Thanks,

8097. Re: [BCD396XT] Programing Question

Conventional frequencies - even P25 conventional, are put in a
Conventional system. LTR was the other option, BTW. You can set the
channel as DIGITAL ONLY and specify the NAC if you like.

Joe, thank you for your response. What does NAC mean? I'm somewhat scanner experienced but never heard of that?

This was answered in another thread on the list, but...

Network Access Code. It's the P25 version of CTCSS.

8103. Firmware Update

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-02 23:48:04 UTC
From: Steve
Topic: 8103 Message: 8103

I am attempting to download the latest firmware update (haven't done it for years when I did it to my BC246T).

I have the USB cable (running Windows 7), downloaded the driver for the cable and the BCD396XT Directory Software. When it comes time to plugging in the cable to the scanner, I hear the tone from the computer recognizing the hardware then when I clock connect to scanner I get the error "cannot open com port 5. Port may be used by other software."

Any idea how to do fix this?

8104. Re: [BCD396XT] Firmware Update

What exactly do you mean by "BCD396XT Directory Software"? I am unfamiliar with that term, and so am having trouble knowing what is generating the error. It doesn't sound like you are running BC_VUP3 (the program used to update the firmware).

For the newest firmware update software, go here.
http://info.uniden.com/twiki/bin/view/UnidenMan4/BCD396XTFirmwareUpdate
With this version, the process is very easy.

Clark

Thank you that worked this time. And I didn't realize but I already had the 1.11.01 version....is that the most current one?

I had the wrong software downloaded but got it now.

Thank you again,

Flashing HOLD indicates you are in system hold mode. To get into or out of that mode, press and hold HOLD for a few seconds.

From: chris451
Topic: 8108 Message: 8110

This is for UPman

I'm a guy that likes to fix it if I can.
I accidently dropped 28 volts across the 6v line on a BC396xt.
I picked up another one to compare voltages.....and get the first one
running again.
This high voltage incident took out a TI audio amp that was shorting the 6v.
It also blew a zener hanging on the power jack.
After I replaced the amp and zener, it powers up but doent like to run
on external power.
Also it degraded the dual mosfet that switches between external and
battery,
(a small SOT 6 pin part down and to the right of the charge jack) so I
can run on battery and sometimes I can charge it but not consistantly.
So I'm trying to figure out if that mosfet is a dual N Dual P or a pair
N and P.
My thinking is its a dual P channel but the part marking is a mystery.
UPman can you take a look at the schematic on the power inlet and tell
me what the dual MOSFET part is? Then I'd have it perfect again. As it
is I have to swap batteries to keep it going,
I think the radio sees low voltage on an A/D and thinks the input
voltage is off.
Also since it wont run on the power jack I can't upgrade firmware til I
get that fixed.
I believe Uniden would say send it in but I haven't checked into that.
Can send a photo if you need it...would be nice if Uniden published the
schematic for this like Icom ane everyone else does, and alignment info
if any.

I have the BC396T and it is not as sensitive as the BC396XT, is that due
to improvements in the design or do I have a 'sick' bc396t? I have had
to repair the input capacitor which gets cracked with use and breaks
apart. I've learned you are not supposed to touch the capacitors with
soldering irons directly as this starts a crack which will eventually
break the part.....

Keeping them running.....chris

Uniden doesn't let schematics out for their own protection. As for fixing the scanners its usually cheaper to let Uniden do it and get it done right with approved parts. Its doubtful UpMan can give you details on the chip in question, again to protect themselves.
